INFRARED SPECTRUM OF THE COMPLEX OF H_2 WITH NH_3 TRAPPED IN SOLID NEON

MARILYN E. JACOX and WARREN E. THOMPSON, *Optical Technology Division, National Institute of Standards and Technology, Gaithersburg, MD 20899*.

When a Ne:NH_3:H_2 sample is deposited at 4.2 K, the vibrational fundamental absorption of H_2 appears, and new structure appears in the infrared absorption patterns of the fundamentals of NH_3. Information regarding the carrier(s) of the new absorptions is obtained by varying the concentration of H_2 and by studies in which it is replaced by HD or by D_2.
