# Outline

- Introduction
- Results from 1<sup>st</sup> Prototype ASIC
- Results from 2<sup>nd</sup> Prototype ASIC
- Summary

# Use of VCSEL Arrays in HEP

- Widely used in off-detector (no radiation) data transmission
- First on-detector implementation is in pixel detector of ATLAS
  - ◆ experience has been positive
    - ⇒ use arrays for the second generation opto-links
    - ⇒ logical for HL-LHC ATLAS pixel detector to use 12-channel arrays as in the 1<sup>st</sup> and 2<sup>nd</sup> generation optical modules (opto-boards)

# Opto-Board for HL-LHC ATLAS Pixel Detector

- Use experience from building two generations of opto-boards to develop an opto-board capable of operation at 5 Gb/s or higher for HL-LHC ATLAS pixel detector (ITK-Pixel)
- What is required to demonstrate that the opto-board concept is a logical solution?
  - 5 Gb/s per channel VCSEL arrays
  - radiation-hard VCSEL array driver
  - robust high speed array based packaging with thermal management
- A working prototype has been constructed

# Opto-Pack for ITK-Pixel

ITK-Pixel

Pixel

- Proposed opto-pack for ITK-Pixel has simpler design
- ◆ continue to use BeO as substrate for heat management
- experience in building large quantity of opto-packs
- ◆ fabricated 1,200 opto-packs for pixel opto-boards
- ◆ fabricating 300 PIN opto-packs for off-detector opto-receivers
- ◆ equivalent to 18,000 channels

# 10 Gb/s VCSEL Array Driver

- R&D funded via CDRD program (FY13-15) of DOE (USA)
- Fabricated 4-channel test chips in 65 nm CMOS
  - ◆ 2 mm x 2 mm
  - ◆ 1<sup>st</sup> prototype submission: October 2014
  - ◆ 2<sup>nd</sup> prototype submission: March 2016
- Uses only core transistors to achieve maximum radiation-hardness
- 8-bit DACs to set the VCSEL modulation and bias currents
  - ◆ DAC settings stored in SEU tolerant registers

Rev. 1

2 mm

Rev. 2

# ITK-Pixel Opto-Board Concept

- Keep opto-pack
- Keep copper backed PCB
- Keep MTP connector
- Compatible with an opto-box (opto crate) concept
- No lenses/mirrors used to turn the light

# ITK-Pixel Opto-Board

Connector secured to opto-board with screws instead of epoxy in current opto-board

Could be fabricated as one piece with mold injection

# New Opto-Board Irradiation

- October 2015: irradiated 8 opto-boards with Rev. 1 array driver using 24 GeV protons at the CERN PS Irradiation facility
- 4 pcs. optical: driving Finisar VCSEL arrays (V850-2174-002)
  - ◆ dose: 13 Mrad
- 4 pcs. electrical: driving resistive load
  - ◆ dose: 111 Mrad

optical

electrical

# New Opto-Board Irradiation

- Chips were powered and monitored during the irradiation at reduced speeds due to the irradiation facility cabling infrastructure
- All channels survived the irradiation and the cooled down chips have been returned to our lab for a study of their performance at high bit rates

# VCSEL Optical Power vs. Dose

- Optical power of irradiated VCSELs decreased with dose as expected
- Annealing occurred (slowly) during times when the VCSELs were removed from the beam
- Monitored 12 out of the 16 VCSEL channels during irradiation due to limited number of fiber connections

annealing

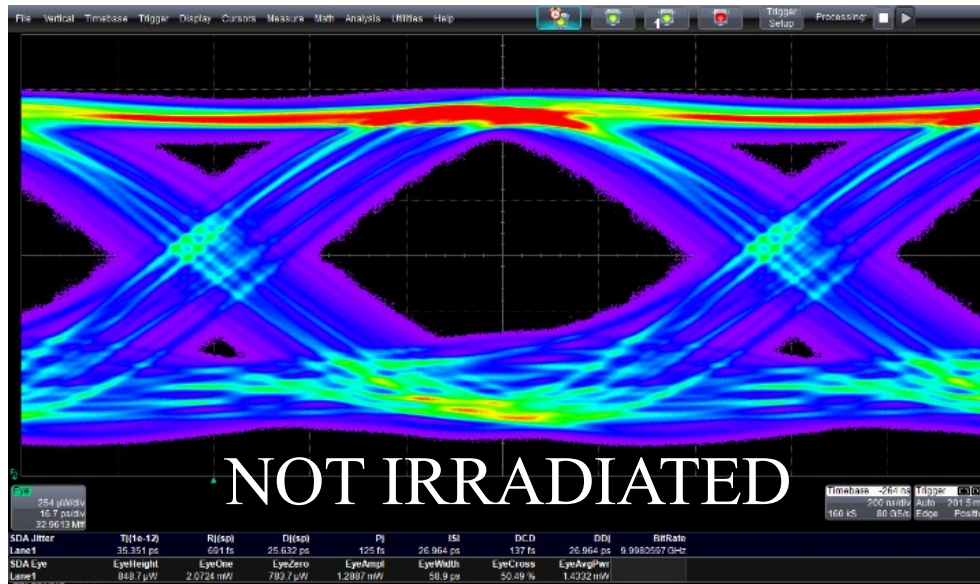

irradiation

# Post Irradiation Results – 10 Gb/s

- All channels operational after irradiation
- Optical amplitude reduced from 2.07 mW to 1.19 mW
  - ◆ consistent with power loss seen during irradiation
- $BER < 5 \times 10^{-14}$  (run error free for more than 30 minutes)
- First demonstration of radiation hardness of an array driver/VCSEL combination at 10 Gb/s with a dose greater than 10 Mrads!

# Post Irradiation Results – 5 Gb/s

- performance of the array driver/VCSEL combination at 5 Gb/s is acceptable after irradiation

# 10 Gb/s Array Driver ASIC Rev. 2

- Rev. 2 has improved architecture for the first three channels, including programmable pre-emphasis current and delay
- One channel was simply a copy of the old design to check for consistency between the versions
- Rev. 2 ASIC is much easier to tune for operation at 10 Gb/s

# 10 Gb/s Array Driver ASIC Rev. 2

- runs at 1.2 V
- ◆ consumes ~150 mA at 10 Gb/s with all four channels operating
- cathode set to -1.3 V to provide enough headroom to drive the VCSEL
- optical power > 2 mW on all channels
- BER <  $5 \times 10^{-14}$  on all channels at 10 Gb/s with every channel active

175  $\mu\text{m}$  space/trace controlled impedance transmission lines

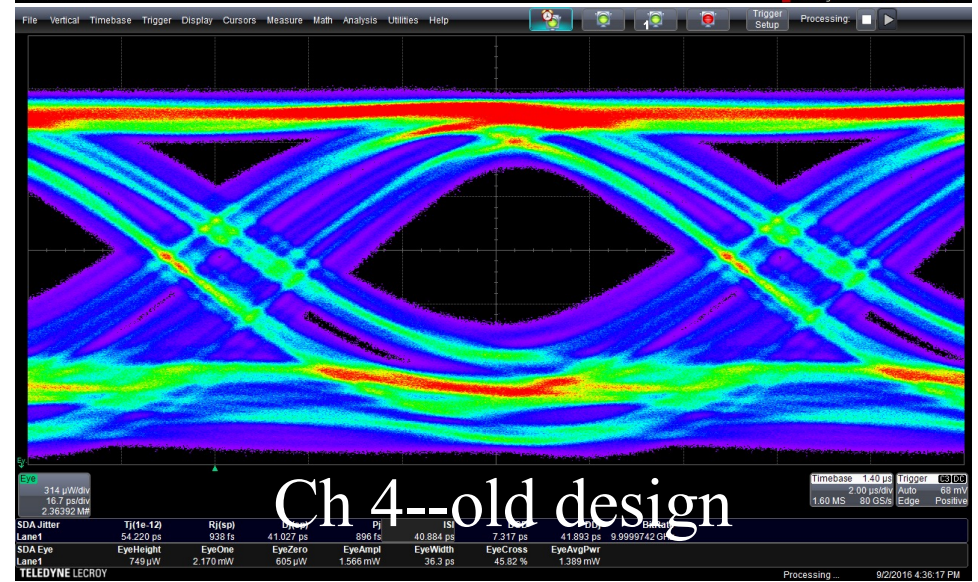

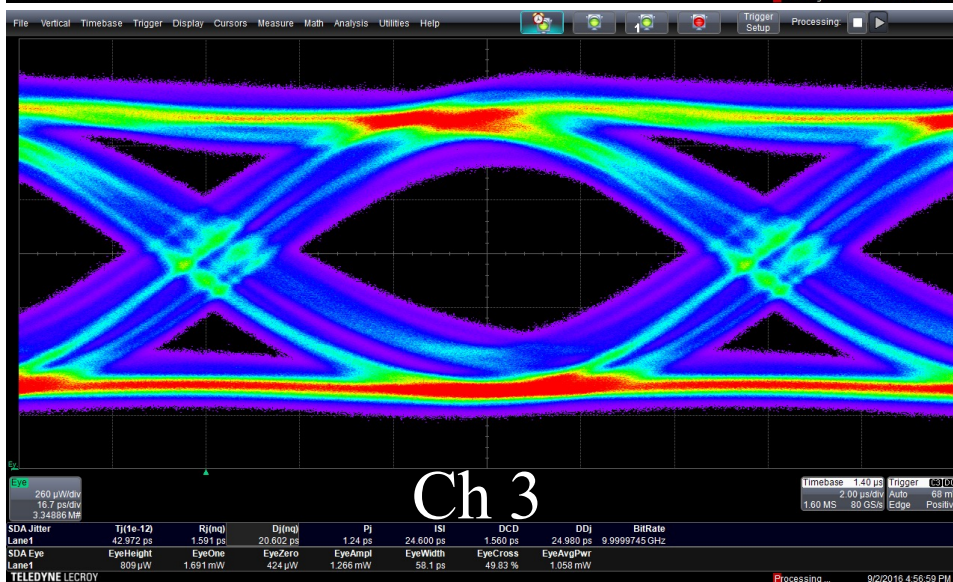

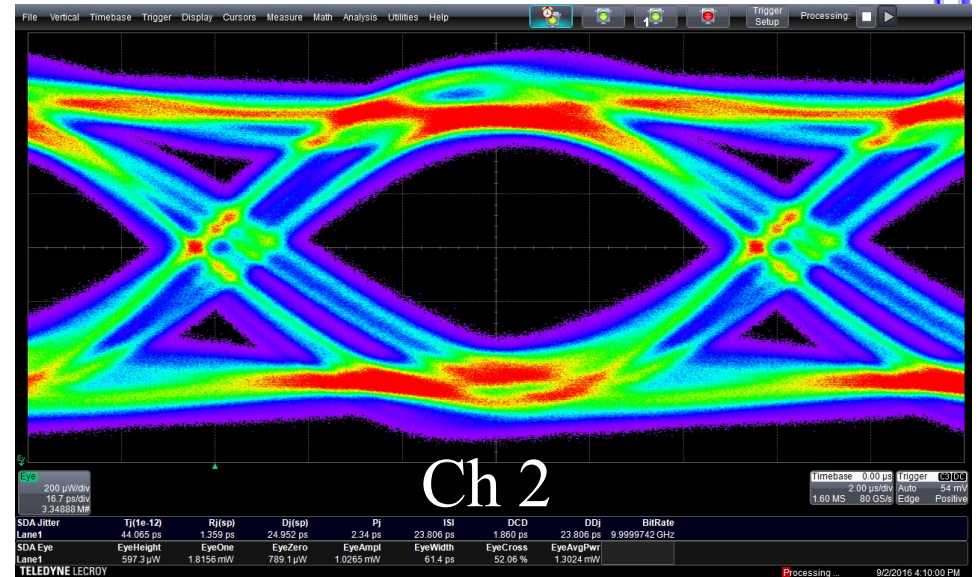

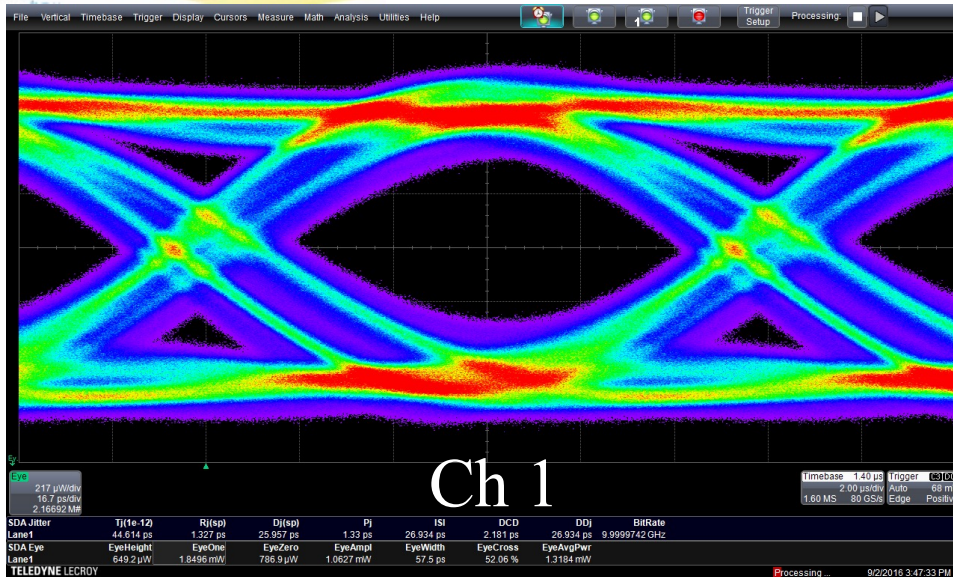

# Array Driver ASIC Rev. 2: 5 Gb/s

# Array Driver ASIC Rev. 2: 10 Gb/s

# Summary

- designed and fabricated a new opto-board including an array driver ASIC and optical packaging to allow 10 Gb/s optical data transmission
- demonstrated the radiation hardness of the combination of a new VCSEL array and an array driver ASIC with successful 10 Gb/s operation after irradiation ( $> 10$  Mrad)
- improved VCSEL array driver has been fabricated
