Hypericin

Hypericin: St. John's wort (*Hypericum perforatum*)

- Photoinduced virucidal and antitumor activities
- Photosensitizer in photodynamical therapy of cancer

H. Falk, *Angew. Chem.*, 1999, **111**, 3306.

Dihydroxyanthraquinones

- Anthracycline antitumor antibiotics, e.g. adriamycin, aclacinomycin and daunomycin

1,8-dihydroxyanthraquinone
1,8-DHAQ

1-aminoanthraquinone
1-AAQ

9-hydroxyphenalenone
9-HPA

Asymmetric Lippincott-Schroeder Potentials

Symmetric Double-Minimum Potentials

1 Experimental Methods & Setups

- Fluorescence Excitation Spectroscopy
- Time-correlated Single Photon Counting

2 Frequency- & Time-domain Measurements

- 1,8-Dihydroxyanthraquinone
- 1-Aminoanthraquinone

3 Summary

- What is the spectroscopic & kinetic evidence for the strength of a particular intramolecular hydrogen bond?
- What is the evidence for the occurrence of excited-state intramolecular H-atom transfer?

- 1 Experimental Methods & Setups
 - Fluorescence Excitation Spectroscopy
 - Time-correlated Single Photon Counting
- 2 Frequency- & Time-domain Measurements
 - 1,8-Dihydroxyanthraquinone
 - 1-Aminoanthraquinone
- 3 Summary
 - What is the spectroscopic & kinetic evidence for the strength of a particular intramolecular hydrogen bond?
 - What is the evidence for the occurrence of excited-state intramolecular H-atom transfer?

Time-domain Experimental Method

Time-correlated Single Photon Counting

many excitation-detection-cycles without any detected photon

many excitation-detection-cycles without any detected photon

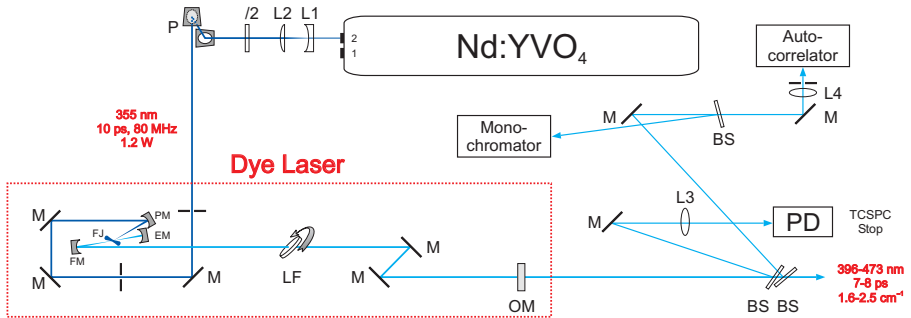

...after many excitation-detection-cycles

Experimental setup

Time-correlated Single Photon Counting: Laser Setup

Experimental setup

Time-correlated Single Photon Counting: Optical Setup

1 Experimental Methods & Setups

- Fluorescence Excitation Spectroscopy
- Time-correlated Single Photon Counting

2 Frequency- & Time-domain Measurements

- 1,8-Dihydroxyanthraquinone
- 1-Aminoanthraquinone

3 Summary

- What is the spectroscopic & kinetic evidence for the strength of a particular intramolecular hydrogen bond?
- What is the evidence for the occurrence of excited-state intramolecular H-atom transfer?

Frequency-domain Measurements

Low-resolution FE Spectrum of 1,8-Dihydroxyanthraquinone

Time-domain Measurements

Energy Dependence of the Fluorescence Lifetimes τ_H

Time-domain Measurements

Two Energy Regimes: $< 600 \text{ cm}^{-1}$ and $> 600 \text{ cm}^{-1}$

Frequency-domain Measurements

Two Energy Regimes: $< 600 \text{ cm}^{-1}$ and $> 600 \text{ cm}^{-1}$

H-Atom Transfer Potentials

H-Atom Transfer Reaction Coordinate R_-

$$R_- = \frac{R_{01H} - R_{02H}}{2}$$

Ab initio H-Atom Transfer Potentials

Relaxed Potential Energy Scans for 1,8-Dihydroxyanthraquinone

Ab initio H-Atom Transfer Potentials

Three Scenarios for the Static & Dynamic Fluorescence Properties

Ab initio H-Atom Transfer Potentials

First Scenario: Herzberg-Teller Coupling

- $< 600 \text{ cm}^{-1}$: $A_2 \times B_2 = b_1$ vibronic bands with c -type rotational structure
- $> 600 \text{ cm}^{-1}$: Symmetry-allowed vibronic transitions with a -type rotational structure

Ab initio H-Atom Transfer Potentials

Second Scenario: Fast Intramolecular H-Atom Transfer

- $< 600 \text{ cm}^{-1}$: Symmetry-allowed vibronic transitions with α -type rotational structure
- $> 600 \text{ cm}^{-1}$: Fast intramolecular H-atom transfer & 1,10-quinone well fluorescence

Ab initio H-Atom Transfer Potentials

Third Scenario: Dual Absorption

- $< 600 \text{ cm}^{-1}$: Non-vertical cross-well excitation into the 1,10-quinone well
- $> 600 \text{ cm}^{-1}$: Vertical excitation into the 9,10-quinone well

Frequency-domain Measurements

Rotational Band Contour of the 0_0^0 Transition

Frequency-domain Measurements

Low-resolution Fluorescence Spectrum of 1-Aminoanthraquinone

Time-domain Measurements

Energy Dependence of the Fluorescence Lifetimes $\bar{\tau}_f$

Time-domain Measurements

Fluorescence Decay Curves

Double-exponential fit: $\bar{\tau}_{fl} = 1.243 \text{ ns}$ at $E_{exc} = 940 \text{ cm}^{-1}$

Time-domain Measurements

Energy Dependence of the Rate Constant k_f of Fluorescence

Time-domain Measurements

Fit according to Fermi's Golden Rule

Fermi's Golden Rule:

$$\frac{1}{\bar{\tau}_{\text{fl}}(E)} = k_{\text{fl}}(E) = k_{\text{rad}} + \underbrace{\frac{2\pi}{\hbar} |V_{if}|^2 \rho_{S_0}(E)}_c$$

Ab initio H-Atom Transfer Potentials

Relaxed Potential Energy Scans for 1-Aminoanthraquinone

Strength of Intramolecular Hydrogen Bonds

Molecules with Different Rotamers

1,8-dihydroxyanthraquinone

1,4-dihydroxyanthraquinone

9-hydroxyphenalenone

tropolone

6-benzanthrone

7-benzanthrone

salicylic acid

o-hydroxybenzaldehyde

naphthazarine

malonaldehyde

1-aminoanthraquinone

?

Quantum Theory of Atoms in Molecules (QTAIM)

Total Charge Density $\rho(\mathbf{r}_c)$ at the Bond Critical Point $(3, -1)$

- Atom in a molecule:

Region of 3D-space bounded by a surface that satisfies the quantum boundary condition of zero flux in the gradient vector field of the charge density:

$$\nabla\rho(\mathbf{r}) \cdot \mathbf{n}(\mathbf{r}) = 0 \quad \text{for} \quad \forall \mathbf{r}.$$

- Necessary condition for a bond between two atoms

The existence of unique line along which the electronic charge density is a maximum with respect to any neighbouring line and which is defined by the two vectors of $\nabla\rho$ which originate at the bond critical point $(3, -1)$.

Quantum Theory of Atoms in Molecules (QTAIM)

Intermolecular Hydrogen Bonds

- Linear $\rho(\mathbf{r}_c)-E_{\text{HB}}$ for intermolecular hydrogen bonds between different nitriles and hydrogen fluoride (HF/6-31G(d,p), $R=0.999$)

R. J. Boyd, S. C. Choi, *Chem. Phys. Lett.*, 1985, 120, 80.

- Linear $\rho(\mathbf{r}_c)-E_{\text{HB}}$ for for intermolecular hydrogen bonds between different nitriles and hydrogen chloride (HF/6-31G(d,p), $R=0.998$)

R. J. Boyd, S. C. Choi, *Chem. Phys. Lett.*, 1986, 129, 62.

- Linear $\rho(\mathbf{r}_c)-E_{\text{HB}}$ relationship for intermolecular hydrogen bonds between different bases and hydrogen fluoride (HF/6-311++G(d,p)//6-31G(d,p), $R=0.869$)

M. T. Carroll, R. F. W. Bader, *Mol. Phys.*, 1988, 65, 695.

- Linear $\rho(\mathbf{r}_c)-E_{\text{HB}}$ relationship for the van der Waals complexes formaldehyde–chloroform, acetone–chloroform, benzene–formaldehyde and 1,1-dichloroethane–acetone (HF/6-31G(d,p), $R=0.998$)

U. Koch, P. L. A. Popelier, *J. Phys. Chem.*, 1995, 99, 9747.

Quantum Theory of Atoms in Molecules (QTAIM)

Linear $\rho(\mathbf{r}_c)-E_{\text{HB}}$ Relationship for *Intramolecular* Hydrogen Bonds

- 1 Experimental Methods & Setups
 - Fluorescence Excitation Spectroscopy
 - Time-correlated Single Photon Counting
- 2 Frequency- & Time-domain Measurements
 - 1,8-Dihydroxyanthraquinone
 - 1-Aminoanthraquinone
- 3 Summary
 - What is the spectroscopic & kinetic evidence for the strength of a particular intramolecular hydrogen bond?
 - What is the evidence for the occurrence of excited-state intramolecular H-atom transfer?

Results on 1,8-dihydroxyanthraquinone

- FE Spectrum exhibits two distinct excess energy ranges.
- Fluorescence bands *below* $\sim 600\text{ cm}^{-1}$ originate in the 9,10-quinone well.
- Fluorescence bands *above* $\sim 600\text{ cm}^{-1}$ originate in the proton-transferred 1,10-quinone well.
- The S_1 potential is double-minimum-type. But the Lippincott-Schroeder picture has to be modified partially.

Results on 1,8-dihydroxyanthraquinone

- FE Spectrum exhibits two distinct excess energy ranges.
- Fluorescence bands *below* $\sim 600\text{ cm}^{-1}$ originate in the 9,10-quinone well.
- Fluorescence bands *above* $\sim 600\text{ cm}^{-1}$ originate in the proton-transferred 1,10-quinone well.
- The S_1 potential is double-minimum-type. But the Lippincott-Schroeder picture has to be modified partially.

Results on 1-aminoanthraquinone

- The S_1 potential is single-minimum-type.
- Uniform energy dependence of the fluorescence lifetimes can be accounted for by Fermi's Golden Rule and is attributed to internal conversion to S_0 .
- Low charge density at the bond critical point $\rho(\mathbf{r}_c)$ in S_0 and the high H-atom transfer barrier in S_1 indicate the weakness of the intramolecular hydrogen bond.
