# Introduction

- Goal:** Study the role of nuclear spins in photoionization of atoms and molecules
- Strategy:** Characterize the dynamics of photoionization channels by studying Rydberg states at ultra-high resolution

## Rydberg states

Rydberg states = ion + Rydberg el.  $(n, \ell)$ :  $E_{n\ell\alpha} = E_{\text{ion}} - \frac{R_M}{(n - \delta_{\ell\alpha})^2} = E_{\text{ion}} - \frac{R_M}{(n^*)^2}$

	Xe (5p) <sup>5</sup> [ <sup>2</sup> P <sub>3/2</sub> ] 54s ( $n^* \approx 50.0$ )	C <sub>6</sub> H <sub>6</sub> [C <sub>6</sub> H <sub>5</sub> CN]
# particles	1 nucleus + 54 electrons	12 nuclei + 42 electrons
mass	131.29 u	78.11 u
radius	$\langle r \rangle \approx 1.5(n^*)^2 a_0$ $\approx 3750 a_0 = 198 \text{ nm}$	$r_{\text{vdW}} \approx 0.35 \text{ nm}$
level spacing	$E_{n+1} - E_n \approx 2R(n^* + 0.5)^{-3}$ $\approx 51.1 \text{ GHz}$	$E_{J+1,K} - E_{J,K} \approx 2B(J+1)$ $\approx (J+1) \cdot 11.4 \text{ GHz}$
(trans.) dipole m.	$\langle n\ell   \mu   n\ell + 1 \rangle \propto (n^*)^2 e a_0$ $\approx 6.4 \cdot 10^3 \text{ D}$	[ $\mu_a = 4.48 \text{ D}$ ]

# Hyperfine structure of $^{129}\text{Xe}^+$ and $^{131}\text{Xe}^+$

# Millimeter wave experiments

## Millimeter wave system

Source: 240–390 GHz Backward Wave Oscillator OB-65 (ISTOK, Russia), 20–40 mW output power

Stabilisation:

Harmonic mixer, HEMT amplifier: Univ. Köln  
Phase lock loop: ETH Zurich

F. Lewen *et al.*, Rev. Sci. Instrum. **69**, 32 (1998).

M. Schäfer *et al.*, J. Phys. B, **39** 831 (2006).

$^{132}\text{Xe}: 61\text{p } [5/2]_2 \leftarrow 52\text{d } [3/2]_1$

Accuracy of the transition  
frequencies: <1 MHz

Photoionization laser  
spectrum of  $^{136}\text{Xe}$   
excited via the  
 $6p [1/2]_0$  state  
( $80118.9839 \text{ cm}^{-1}$   
above the  $^1S_0$   
ground state)

# Multichannel quantum defect theory (MQDT)

MQDT: Ham; Seaton; Fano.

Xe: K. T. Lu, Phys. Rev. A **4**, 579 (1971).

hf structure ( $^{83}\text{Kr}$ ): H. J. Wörner, U. Hollenstein, F. Merkt, Phys. Rev. A **68**, 032510 (2003)

close-coupling region:

strong **ion core–electron interaction**

(exchange, spin–orbit interaction)

$LS$  coupling

$$\vec{L}^+ + \vec{\ell} = \vec{L}, \quad \vec{S}^+ + \vec{s} = \vec{S},$$

$$\vec{L} + \vec{S} = \vec{J}, \quad \vec{J} + \vec{I} = \vec{F}$$

close-coupling eigenchannels  $\alpha$

long-range region:

Coulomb field, ion energy levels

(incl. **hyperfine interaction**)

$jj$  coupling

$$\vec{L}^+ + \vec{S}^+ = \vec{J}^+, \quad \vec{J}^+ + \vec{I} = \vec{F}^+,$$

$$\vec{\ell} + \vec{s} = \vec{j}, \quad \vec{F}^+ + \vec{j} = \vec{F}$$

dissociation channels  $i$

angular momentum  
frame transformation

Rydberg states:  $jK$  coupling

$$\vec{L}^+ + \vec{S}^+ = \vec{J}^+, \quad \vec{J}^+ + \vec{\ell} = \vec{K}, \quad \vec{K} + \vec{s} = \vec{J}, \quad \vec{J} + \vec{I} = \vec{F}$$

Each bound level  $E$  is determined by:

$$\det |U_{i(F)\alpha} \sin[\pi(\mu_\alpha + \nu_{i(F)})]| = 0$$

- eigen quantum defects  $\mu_\alpha$ :  $\mu_\alpha = \mu_\alpha^{(0)} + \epsilon \mu_\alpha^{(1)}$  with  $\epsilon = [E - E(^2P_{J^+})]/R_M$
- transformation matrix  $U_{i(F)\alpha}$  between close-coupling eigenchannels  $\alpha$  and dissociation channels  $i$

$$U_{i(F)\alpha} = \sum_{\bar{\alpha}} U_{i(F)\bar{\alpha}} V_{\bar{\alpha}\alpha}$$

where  $U_{i\bar{\alpha}} = \langle LSJ | J^+ j J \rangle$  or  $U_{i_F \bar{\alpha}} = \langle LSJF | J^+ F^+ j F \rangle$ ,  $V_{\bar{\alpha}\alpha}$  accounts for the small departure of the close-coupling eigenchannels from pure  $LS$  coupling (where no s-d or p-f interaction occurs):  $\mathbf{V} = \prod_{i,j>i}^N \mathbf{R}(\theta_{ij})$

- positions of the ionization thresholds  $E(^2P_{J^+(F^+)})$  (incl. hyperfine structure)

$$\nu_{i(F)} \equiv \nu_{J^+F^+}(E) = \sqrt{R_M / (E(^2P_{J^+(F^+)}) - E)}$$

# Hyperfine structure of $^{129}\text{Xe}$

## Analysis and MQDT Calculations

Rydberg series of even Xe isotopes ( $I = 0$ ):

$$\begin{aligned} n\ell[K]_J &= (5p)^5 [^2P_{3/2}] n\ell[K]_J & \ell &= 0, 1, 2, 3, \dots \text{ (s,p,d,f,...)} \\ n\ell'[K]_J &= (5p)^5 [^2P_{1/2}] n\ell[K]_J & K &= |J^+ - \ell|, \dots, J^+ + \ell, \quad J = K \pm 1/2 \end{aligned}$$

e.g., 10  $np$  series:  $np [1/2]_{0,1}$ ,  $np [3/2]_{1,2}$ ,  $np [5/2]_{2,3}$ ,  $np' [1/2]_{0,1}$ ,  $np' [3/2]_{1,2}$

$$\text{Rydberg formula: } E_{n\ell K J} = E(^2P_{J^+}) - \frac{R_M}{(n - \delta_{\ell K J})^2} = E(^2P_{J^+}) - \frac{R_M}{(\nu_{J^+})^2}$$

$$\text{effective principal quantum number } \nu_{J^+}(E) = \left[ \frac{R_M}{E(^2P_{J^+}) - E} \right]^{1/2}$$

$$\begin{aligned} ^{132}\text{Xe: } E(^2P_{3/2}) &= 97\,833.790 \text{ cm}^{-1}, \quad E(^2P_{1/2}) = 108\,370.714 \text{ cm}^{-1}, \\ R_M &= 109\,736.8593 \text{ cm}^{-1} \end{aligned}$$

Series	$n$					$\delta_{\ell K J}$

$nf [3/2]_2$	57	58	59	60	61	0.05509(12)
$nf [3/2]_1$	57	58	59	60	61	0.05804(12)
$np [3/2]_2$	60	61	62	63		3.50050(12)
$np [3/2]_1 \left\{ \right.$	60	61	62	63		3.51734(12)
	60	61	62	63		3.51807(12)
$np [5/2]_2$	60	61	62	63		3.55872(12)
$np [1/2]_1$	60	61	62	63		3.59870(12)
$ns [3/2]_1$	54	55	56			3.99423(8)
$nd [3/2]_1$	52	53	54	55		2.21505(8)
$nd [1/2]_1$	52	53	54	55		2.51732(8)

Hyperfine structure of the ion:

$$E(J^+, F^+) = E(J^+) + A_{J^+} \frac{C^+}{2} + B_{J^+} \frac{\frac{3}{4}C^+(C^+ + 1) - I(I + 1)J^+(J^+ + 1)}{2I(2I - 1)J^+(2J^+ - 1)}$$

where  $C^+ = F^+(F^+ + 1) - I(I + 1) - J^+(J^+ + 1)$

and  $B_{J^+} = 0$  for  $J^+ < 1$  or  $I < 1$

( $A_{J^+}$ ,  $B_{J^+}$ : magnetic dipole and electric quadrupole hyperfine parameter of the ion)

	<sup>129</sup> Xe	<sup>131</sup> Xe
$A(^2P_{3/2}) / \text{cm}^{-1}$	$\approx -0.054(15) \text{ cm}^{-1}$	$\approx 0.014(5) \text{ cm}^{-1}$
$B(^2P_{3/2}) / \text{cm}^{-1}$	—	$\approx 0.006(5) \text{ cm}^{-1}$
$A(^2P_{1/2}) / \text{cm}^{-1}$	$-0.4071(9) \text{ cm}^{-1}$	$0.1206(3) \text{ cm}^{-1}$
