Bruker IFS 125HR high-resolution Fourier transform spectrometer

- 10 m path difference
- resolution of  $0.001 \text{ cm}^{-1}$

**With successive improvements, the synchrotron now has a significant advantage over the globar from  $350 \sim 800 \text{ cm}^{-1}$ , and reasonable advantage over the Hg lamp from  $150\text{-}350 \text{ cm}^{-1}$ .**

UNB

Malonaldehyde - a 5-membered 'open ring' molecule.

There are 21 normal modes of small-amplitude vibration (11 are shown).

However, the motion of the hydrogen nucleus attached to the oxygen is rather special...

Tayyari and Milani-Nejad  
*Spectrochimica Acta* **54**, 255 (1998)

The topmost proton could associate with either oxygen atom.

UNB

The topmost proton could associate with either oxygen atom.

UNB

The proton associated with the oxygen atoms experiences a double-well potential

## Excitation of the oxygen-hydrogen bond increases the tunnelling-splitting

UNB

Rotation-vibration spectra of the fundamental vibrations will all show tunnelling-splitting, but the vibrational motion will modify it.

UNB

## Energy level diagram for vibrations of malonaldehyde

## Sample preparation and handling!

- Many thanks to David MaGee for producing the sodium-salt of malonaldehyde!
- Many thanks to Brant Billinghamurst for helping with the conversion from the salt to malonaldehyde at the CLS

UNB

## Spectrum overview

UNB

## Three fundamental vibrational bands of malonaldehyde

## Relative tunnelling-splitting in three vibrational bands

UNB

Wasserman et al, PCCP **8**, 2344 (2006)

For a detailed determination of the splitting, we need to perform a rotational analysis of the bands

We must include terms related to products as well as moments of inertia!

For a detailed determination of the splitting, we need to perform a rotational analysis of the bands

## Preliminary results of fitting our three bands (in $\text{cm}^{-1}$ )

Parameter	Ground state	$\nu_{20}$	$\nu_{14}$	$\nu_{19}$
$T_0$	0.0	386.744	508.775	767.2925
$\Delta E$	21.58314	14.47	15.395	22.500
$A$	0.328021667	0.3277436	0.328987	0.3277305
$B$	0.173871472	0.1736465	0.1730581	0.1734395
$C$	0.113557783	0.1134916	0.1132003	0.11399315
(product of inertia)	0.00153094	0.0013609	0.00233617	0.0005851

UNB

## Energy level diagram for vibrations of malonaldehyde

We can see features corresponding to heads assigned to the  $\nu_{21}$  and  $\nu_{15}$  bands...

UNB

...so what are these two *a*-type bands, then??

## What we've learned so far...

- We can do this!! We know how to synthesize malonaldehyde, and how to take its rotation-vibration spectra at very high resolution at the CLS.
- The tunnelling-splitting in excited vibrational states can be determined with very high accuracy from our data, and we can see how it changes as different vibrational modes of the molecule are excited.
- We have found an intriguing new low-lying level that is not part of a conventional small-amplitude motion analysis of the vibrational structure.

## ***Fin du séminaire!***

Special thanks to Dave MaGee (UNB Chemistry) and Brant Billinghamurst (Canadian Light Source) for their help in synthesizing the malonaldehyde.

Thanks to NSERC, UNB, and the Canadian Light Source for funding and other forms of support.
