der, CO 80309-0427*.

Both furan (C_4H_4O) and furfural (C_4H_3O-CHO) are important products in biomass pyrolysis. We have used a resistively-heated SiC tubular reactor with a 30 microseconds residence time to study the thermal cracking of furan. The decomposition products are identified by two independent techniques: 118.2 nm VUV photoionization mass spectroscopy and infrared spectroscopy. We observe three different thermal dissociation channels leading to: a) $CH_3CCH + CO$ b) $HCCH + CH_2CO$ c) $HCCCH_2$.
