

INTRAMOLECULAR CHARGE TRANSFER STATES IN THE CONDENSED PHASE

C. F. WILLIAMS and J. M. HERBERT, *Ohio State Chemistry Department, Newman and Wolfrom Lab, 100 W. 18th Avenue Columbus, OH, 43210.*

Time-Dependent Density Functional Theory (TDDFT) with long range corrected functionals^a can give accurate results for the energies of electronically excited states involving Intramolecular Charge Transfer (ICT) in large molecules. If this is combined with a Molecular Mechanics (MM) representation of the surrounding solvent this technique can be used to interpret the results of condensed phase UV-Vis Spectroscopy. Often the MM region is represented by a set of point charges, however this means that the solvent cannot repolarize to adapt to the new charge distribution as a result of ICT and so the excitation energies to ICT states are overestimated. To solve this problem an algorithm that interfaces TDDFT with the polarizable force-field AMOEBA is presented; the effect of solvation on charge transfer in species such as 4,4'-dimethylaminobenzonitrile (DMABN) is discussed.
