- 1) Taylor, Problem 10.3, page 241.
- 2) Taylor, Problem 11.3, page 256.
- 3) A telemarketer made 100 calls in one day with a 10% success rate of making a sell. What is the error on the success rate?
- 4) The sun emits an enormous number of neutrinos. Assume that  $10^6$  solar neutrinos uniformly pass through a square with an area of  $1 \text{ m}^2$  each  $\mu\text{sec}$ . Inside the square is a neutrino detector with an area of  $1 \text{ mm}^2$ . Assume Poisson statistics for this problem.
  - a) What is the average number of neutrinos going through the detector each  $\mu\text{sec}$ ?
  - b) What is the probability that no neutrinos go through the detector in a  $\mu\text{sec}$ ?
  - c) What is the probability that  $\geq 2$  neutrinos go through the particle detector in a  $\mu\text{sec}$ ?
  - d) How big should the detector be (in  $\text{mm}^2$ ) if we want  $\geq 2$  particles per  $\mu\text{sec}$  to pass through the detector with a probability of 95%?
- 5) Suppose a missile defense system destroys an incoming missile 95% of the time.
  - a) If an evil country launches 20 missiles what is the probability that the missile defense system will destroy all of the incoming missiles?
  - b) How many missiles have to be launched to have a 50% chance of at least one missile making it through the defense system?Note: this problem can be done using either binomial or Poisson statistics.
- 6) Assuming a Gaussian probability distribution answer the following questions  
(Use Tables in *Taylor Appendix A and/or B*):
  - a) What is the probability of a value lying more than  $1.5\sigma$  from the mean?
  - b) What is the probability of a value lying  $\geq 1.5\sigma$  above the mean?
  - c) What is the probability of a value lying  $\leq 1.5\sigma$  below the mean?
  - d) What is the probability of a value,  $y$ , lying in the range  $\mu - \sigma \leq y \leq \mu + 2\sigma$ ?
  - e) What is the probability of a value,  $y$ , lying in the range  $\mu + \sigma \leq y \leq \mu + 2\sigma$ ?For this problem  $\mu$  is the mean of the Gaussian and  $\sigma$  is its standard deviation.
- 7) Taylor, Problem 5.12, page 156.
- 8) Suppose 100 six-sided dice are tossed. Assume that the faces are labeled by one through six dots. Let  $Y_i$  be the number of dots on the  $i$ th ( $i=1$  to 100) die.
  - a) What is the average number of dots expected for a single dice?
  - b) What is the variance of the numbers of dots expected for a single dice?
  - c) Use the Central Limit Theorem to estimate the probability that the sum of the  $Y_i$ 's exceeds 400.

9) A Central Limit Theorem problem. When a certain chemical product is prepared the amount of a certain impurity is a random variable with a mean of 4 grams and a standard deviation of 2 grams. If 100 independent batches of the chemical are produced what is the (approximate) probability of the average amount of the impurity in the 100-batch sample being more than 4.5 grams?
