## Physics 416 Problem Set 2 Due Thursday, May 6, 2003

- 1) Taylor, Problem 10.10, page 242. In addition answer the following:
  - d) On average how many patients survive?
  - e) The probability that all four patients survive.
- 2) Assuming a Gaussian probability distribution answer the following questions (Use Tables in *Taylor Appendix A and/or B*):
  - a) What is the probability of a value lying more than  $1.5\sigma$  from the mean?
  - b) What is the probability of a value lying  $\ge 1.5\sigma$  above the mean?
  - c) What is the probability of a value lying  $\leq 1.5\sigma$  below the mean?
  - d) What is the probability of a value, y, lying in the range  $\mu \sigma \le y \le \mu + 2\sigma$ ?
  - e) What is the probability of a value, y, lying in the range  $\mu + \sigma \le y \le \mu + 2\sigma$ ?

For this problem  $\mu$  is the mean of the Gaussian and  $\sigma$  is its standard deviation.

3) Taylor, Problem 5.12, page 156.

4) The sun emits an enormous number of neutrinos. Assume that  $10^6$  solar neutrinos uniformly pass through a square with an area of 1 m<sup>2</sup> each µsec. Inside the square is a neutrino detector with an area of 1 mm<sup>2</sup>. Assume Poisson statistics for this problem.

a) What is the average number of neutrinos going through the detector each µsec?

- b) What is the probability that no neutrinos go through the detector in a  $\mu$ sec?
- c) What is the probability that  $\geq$  two neutrinos go through the particle detector in a µsec?

d) How big should the detector be (in mm<sup>2</sup>) if we want  $\ge 1$  particles per µsec to pass through the detector with a probability of 99%?

- 5) Taylor, Problem 11.18, page 259.
- 6) Suppose a missile defense system destroys an incoming missile 95% of the time.
  - a) If an evil country launches 20 missiles what is the probability that the missile defense system will destroy all of the incoming missiles?

b) How many missiles have to be launched to have a 50% chance of at least one missile making it through the defense system?

Note: this problem can be done using either binomial or Poisson statistics.

7) According to quantum mechanics, the position (x) of a particle in a one dimensional box with dimensions -  $L/2 \le x \le L/2$  (*L* constant) can be described by the following probability distribution function p(x):

 $p(x) = A\cos^2[\pi x/L]$  for  $-L/2 \le x \le L/2$ , and 0 for all other x.

a) Find the normalization constant A in terms of L.

b) Find the mean, mode, and median position of the particle in the box.

c) Show that the variance ( $\sigma^2$ ) of x is given by:

$$\sigma^2 = \left(\frac{L}{\pi}\right)^2 \frac{\pi^2 - 6}{12}$$

d) What is the probability of finding the particle in the region:  $L/4 \le x \le L/2$ ?

8) Suppose 100 six sided dice are tossed. Assume that the faces are labeled by one through six dots. Let  $Y_i$  be the number of dots on the *i*th (*i* =1 to 100) die.

a) What is the average number of dots expected for a single dice?

b) What is the variance of the numbers of dots expected for a single dice?

c) Use the Central Limit Theorem to estimate the probability that the sum of the  $Y_i$ 's exceeds 400.

9) In the Bohr theory of the structure of the hydrogen atom the energies of the various quantum states are given by:

$$E_n = -\frac{me^4}{2N^2\hbar^2}$$

With: *m* the mass of the electron *e* the electric charge of the electron  $\hbar$  Planck's constant divided by  $2\pi$ 

If:  $\sigma_m/m = 0.1\%$  (i.e. the mass is known to 0.1%)  $\sigma_e/e = 0.2\%$  (i.e. the charge is known to 0.2%)  $\sigma_h/\hbar = 0.1\%$ 

a) Calculate  $\sigma_E/E$  for arbitrary *N*.

b) If the precision of  $\sigma_E/E$  is to be improved which of the three quantities should be determined more pecisely?

10) Taylor, Problem 3.28, page 85.

11) A Central Limit Theorem problem. When a certain chemical product is prepared the amount of a certain impurity is a random variable with a mean of 4 grams and a standard deviation of 2 grams. If 100 independent batches of the chemical are produced what is the (approximate) probability of the average amount of the impurity in the 100-batch sample being more that 4.5 grams?
