## Magnetic Dipole and Electric Quadrupole (cont'd)

$$\vec{A}(\vec{x}) = \frac{\mu_0}{4\pi} \frac{e^{ikr}}{r} \int d^3x' \vec{J}(\vec{x}') \sum_{n=0}^{\infty} \frac{(-ik)^n}{n!} (\hat{n} \cdot \vec{x}')^n$$

$n=1$  term

$$\vec{A}(\vec{x}) = \frac{\mu_0}{4\pi} \frac{e^{ikr}}{r} (-ik) \int d^3x' \vec{J}(\vec{x}') (\hat{n} \cdot \vec{x}')$$

write  $\vec{J}(\hat{n} \cdot \vec{x}') = \frac{1}{2} [(\hat{n} \cdot \vec{x}') \vec{J} + (\hat{n} \cdot \vec{J}) \vec{x}'] + \frac{1}{2} (\vec{x}' \times \vec{J}) \times \hat{n}$

(a) 2<sup>nd</sup> term:

$$\vec{A}(\vec{x}) = \frac{ik\mu_0}{4\pi} \frac{e^{ikr}}{r} \hat{n} \times \vec{m}$$

$\vec{m}$  = magnetic dipole

$$\vec{H} = \frac{k^2}{4\pi} \frac{e^{ikr}}{r} (\hat{n} \times \vec{m}) \times \hat{n}$$

$$\vec{E} = \frac{k^2}{4\pi} \sqrt{\frac{\mu_0}{\epsilon_0}} \frac{e^{ikr}}{r} \vec{m} \times \hat{n}$$

$$\frac{dP}{d\Omega} = \frac{k^4}{32\pi^2} \sqrt{\frac{\mu_0}{\epsilon_0}} |\hat{n} \times \vec{m}|^2$$

$\sim$  angular power distribution

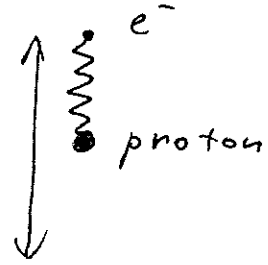

Example | Atom as a harmonic oscillator:  
(hydrogen)

(97)

the position of electron is

$$\vec{X}(t) = \hat{z} r_0 \cos(\omega t) = \hat{z} \operatorname{Re} [r_0 e^{-i\omega t}]$$

~~$$\Psi(\vec{r}, t) = \delta(x) \delta(y) \delta(z - r_0 \cos(\omega t))$$~~

~~$$\langle \delta(\vec{r}, t) | \delta(x) e^{-i\omega t} | \delta(x) \rangle$$~~

$$\Rightarrow \vec{p} = -e \dot{\vec{X}}(t) = -e \hat{z} r_0 \omega \operatorname{Re} e^{-i\omega t}$$

$$\Rightarrow \frac{dP}{d\Omega} = \frac{c^2}{32\pi^2} \sqrt{\frac{\mu_0}{\epsilon_0}} k^4 |\vec{p}|^2 \sin^2 \theta = \frac{c^2}{32\pi^2} \sqrt{\frac{\mu_0}{\epsilon_0}} k^4 \cdot e^2 r_0^2 \sin^2 \theta$$

$$\cdot e^2 r_0^2 \sin^2 \theta$$

$$\Rightarrow \frac{dP}{d\Omega} = \frac{1}{32\pi^2} \sqrt{\frac{\mu_0}{\epsilon_0}} \frac{\omega^4}{c^2} e^2 r_0^2 \sin^2 \theta$$

$$\Rightarrow P = \frac{1}{12\pi^2} \sqrt{\frac{\mu_0}{\epsilon_0}} \frac{\omega^4}{c^2} |\vec{p}|^2 = \frac{1}{12\pi^2} \sqrt{\frac{\mu_0}{\epsilon_0}} \frac{\omega^4}{c^2} e^2 r_0^2 = P$$

total radiated power.

~ Such classical atom would radiate energy

$\Rightarrow$  the electron would eventually fall on the proton  $\Rightarrow$  need quantum mechanics to save the day!

# Magnetic Dipole and Electric Quadrupole

Take the  $n=1$  term:

$$\vec{A}(\vec{x}) = \frac{\mu_0}{4\pi} \frac{e^{ikr}}{r} (-ik) \int d^3x' \vec{J}(\vec{x}') \hat{n} \cdot \vec{x}'$$

$$\vec{J}(\hat{n} \cdot \vec{x}') = \frac{1}{2} \left[ (\hat{n} \cdot \vec{x}') \vec{J} + (\hat{n} \cdot \vec{J}) \vec{x}' \right] + \frac{1}{2} (\vec{x}' \times \vec{J}) \times \hat{n}$$

as  $J_i x_j = \frac{1}{2} (J_i x_j + J_j x_i) + \frac{1}{2} (J_i x_j - J_j x_i)$

(a) take the 2nd term first: remember the magnetization

$$\vec{M} = \frac{1}{2} \vec{x} \times \vec{J} \Rightarrow \text{the 2nd term gives}$$

$$\vec{A}(\vec{x}) = \frac{ik\mu_0}{4\pi} \frac{e^{ikr}}{r} \int d^3x' \hat{n} \times \vec{M}(\vec{x}') \Rightarrow$$

$$\Rightarrow \vec{A}(\vec{x}) = \frac{ik\mu_0}{4\pi} \frac{e^{ikr}}{r} \hat{n} \times \vec{m} \sim \text{magnetic dipole radiation.}$$

where  $\vec{m}$  is the magnetic dipole moment:

$$\vec{m} = \int d^3x' \vec{M}(\vec{x}')$$

$$\frac{dP}{d\Omega} = \frac{k^4}{32\pi^2} \sqrt{\frac{\mu_0}{\epsilon_0}} |\hat{n} \times \vec{m}|^2$$

$$\Rightarrow \text{can find } \vec{E}, \vec{H}: \vec{H} = \frac{k^2}{4\pi} \frac{e^{ikr}}{r} (\hat{n} \times \vec{m}) \times \hat{n}; \vec{E} = \frac{1}{4\pi} \sqrt{\frac{\mu_0}{\epsilon_0}} k^2 \vec{m} \times \hat{n} \frac{e^{ikr}}{r}$$

(b) take the 1st term:  $\frac{1}{2} \int d^3x' [n_i x'_i J_j + n_i J_i x'_j] =$

$$= \frac{1}{2} \int d^3x' \vec{J} \cdot \vec{\nabla}' (x'_j (\hat{n} \cdot \vec{x}')) = (\text{parts}) = -\frac{1}{2} \int d^3x' x'_j (\hat{n} \cdot \vec{x}') \rho(\vec{x}') \Rightarrow$$

$$\underbrace{\vec{\nabla}' \cdot \vec{J}}_{i\omega\rho} = -\frac{i\omega}{2} \int d^3x' x'_j (\hat{n} \cdot \vec{x}') \rho(\vec{x}') \Rightarrow$$

$$\Rightarrow \vec{A}(\vec{x}) = -\frac{\mu_0}{4\pi} \frac{\omega k}{2} \frac{e^{ikr}}{r} \int d^3x' \cdot \vec{x}' (\hat{n} \cdot \vec{x}') \rho(\vec{x}')$$

electric quadrupole radiation:

$$\vec{H} = \frac{1}{\mu_0} \vec{\nabla} \times \vec{A} \approx \frac{ik}{\mu_0} \hat{n} \times \vec{A}; \quad \vec{E} = \frac{i}{\omega \epsilon_0} \vec{\nabla} \times \vec{H} =$$

$$\approx \frac{i}{\omega \epsilon_0} ik \hat{n} \times \vec{H} = -\frac{1}{c \epsilon_0} \frac{ik}{\mu_0} \hat{n} \times (\hat{n} \times \vec{A}) = -i\omega \hat{n} \times (\hat{n} \times \vec{A})$$

To find  $\vec{H}$  need  $\hat{n} \times \int d^3x' \cdot \vec{x}' (\hat{n} \cdot \vec{x}') \rho(\vec{x}')$ .

Quadrupole moment tensor  $Q_{ij} = \int d^3x (3x_i x_j - r^2 \delta_{ij}) \rho$

$$\Rightarrow \left[ \hat{n} \times \int d^3x' \cdot \vec{x}' (\hat{n} \cdot \vec{x}') \rho(\vec{x}') \right]_i = \epsilon_{ijk} n_j \int d^3x' \cdot x'_k \rho(\vec{x}')$$

$$n_e \cdot x'_e \rho(\vec{x}') = \frac{1}{3} \epsilon_{ijk} n_j n_e Q_{kel} = \frac{1}{3} \hat{n} \times \vec{Q}$$

with  $(\vec{Q})_i = Q_{ij} n_j \Rightarrow \vec{H} = -\frac{i}{8\pi} \frac{\omega k^2}{r} \frac{e^{ikr}}{r} \frac{1}{3} \hat{n} \times \vec{Q}$

$$\vec{E} = -\frac{1}{c \epsilon_0} \hat{n} \times \vec{H} = \frac{i}{24\pi} \frac{\omega k^2}{c \epsilon_0} \frac{e^{ikr}}{r} \hat{n} \times (\hat{n} \times \vec{Q})$$

Radiated power is (time averaged)

$$\frac{dP}{d\Omega} = \frac{1}{2} \text{Re} [r^2 \hat{n} \cdot (\vec{E} \times \vec{H}^*)] = \frac{1}{2} r^2 \frac{1}{3^2 (8\pi)^2} \frac{\omega^2 k^4}{c \epsilon_0} \frac{1}{r^2}$$

$$\cdot \hat{n} \cdot ((\hat{n} \times (\hat{n} \times \vec{Q})) \times (\hat{n} \times \vec{Q}^*))$$

$$\vec{E} = -\frac{1}{c\epsilon_0} \hat{n} \times \vec{H} \Rightarrow \frac{dP}{d\Omega} = \frac{r^2}{2} \operatorname{Re}[\hat{n} \cdot (\vec{E} \times \vec{H}^*)] = \frac{r^2}{2} \left(\frac{-1}{c\epsilon_0}\right)$$

$$\operatorname{Re}[\hat{n} \cdot ((\hat{n} \times \vec{H}) \times \vec{H}^*)] = \frac{r^2}{2c\epsilon_0} |\vec{H}|^2 = \frac{r^2}{2c\epsilon_0} \cdot \frac{1}{64\pi^2} \omega^2 k^4 \frac{1}{r^2} \frac{1}{9}$$

$$-\vec{H}^* \times (\hat{n} \times \vec{H}) = -\hat{n} |\vec{H}|^2 + \vec{H} (\hat{n} \cdot \vec{H}^*) = -\hat{n} |\vec{H}|^2$$

$$|\hat{n} \times \vec{Q}|^2 = \frac{\omega^2 k^4}{18c\epsilon_0 64\pi^2} |\hat{n} \times \vec{Q}|^2$$

$\delta_{jj'} \delta_{kk'} - \delta_{jk'} \delta_{kj'}$

$$(\hat{n} \times \vec{Q})^2 = (\epsilon_{ijk} n_j Q_{kl} n_l)^2 = (\epsilon_{ijk} n_j Q_{kl} n_l \cdot \epsilon_{ij'k'})$$

$$n_j Q_{kl} n_l n_j Q_{k'l'} n_{l'} = n_j Q_{kl} n_l n_j Q_{k'l'} n_{l'} - n_j Q_{kl} n_l n_k Q_{j'l'} n_{l'}$$

$$= Q_{kl} n_l Q_{k'l'} n_{l'} - Q_{kl} n_k n_l Q_{j'l'} n_{l'}$$

$$\Rightarrow \frac{dP}{d\Omega} = \frac{c k^6}{2(24\pi)^2 \epsilon_0} [Q_{ij} n_j Q_{ik}^* n_k - Q_{ij} n_i n_j Q_{kl}^* n_k n_l]$$

note:  $\frac{dP}{d\Omega} \text{ dipole} \sim k^4 \vec{p}^2 \sim \frac{1}{\lambda^4} \cdot d^2 \sim \frac{1}{\lambda^2} \frac{d^2}{\lambda^2}$

$$\frac{dP_{\text{quad}}}{d\Omega} \sim k^6 Q^2 \sim \frac{1}{\lambda^6} \cdot d^4 \sim \frac{1}{\lambda^2} \left(\frac{d^2}{\lambda^2}\right)^2$$

an expansion is in  $d/\lambda$ , as advertised!

~~$$P = \frac{1}{2} \left( \frac{1}{4} \frac{x^2}{Q_0^2} + \frac{1}{4} \frac{y^2}{Q_0^2} + \frac{z^2}{Q_0^2} \right) \frac{Q_{xx}}{2} \frac{1}{\lambda^2} \frac{1}{\epsilon_0} \left( \frac{x^2 + y^2}{2 Q_0^2} + \frac{z^2}{Q_0^2} \right)$$~~

$$Q_i = Q_{ij} n_j =$$

Alternatively,

$$\hat{n} \cdot [(\hat{n} \times (\vec{u} \times \vec{Q})) \times (\hat{n} \times \vec{Q}^*)] = \hat{n} \cdot [(\hat{n} (\hat{n} \cdot \vec{Q}) - \vec{Q}) \times \quad (10)$$

$$\times (\hat{n} \times \vec{Q}^*)] = \hat{n} \cdot [(\hat{n} \cdot \vec{Q}) (\hat{n} (\hat{n} \cdot \vec{Q}^*) - \vec{Q}^*) - \hat{n} (|\vec{Q}|^2 + \vec{Q} \cdot (\hat{n} \cdot \vec{Q}^*))]$$

$$= (\hat{n} \cdot \vec{Q})^2 - |\vec{Q}|^2 + (\hat{n} \cdot \vec{Q})^2 = -Q_{ij} n_j Q_{ik}^* n_k +$$

$$+ Q_{ij} n_i n_j Q_{ke}^* n_k n_e$$

$$\Rightarrow \frac{dP}{d\Omega} = \frac{ck^6}{2(24\pi)^2 \epsilon_0} (Q_{ij} n_j Q_{ik}^* n_k - Q_{ij} n_i n_j Q_{ke}^* n_k n_e)$$

One can integrate this using  $Q_{ii} = 0 \Rightarrow$

$$P = \frac{ck^6}{1440\pi \epsilon_0} |Q_{ij}|^2$$

$$\text{Here } |Q_{ij}|^2 \equiv Q_{ij} Q_{ij}^* = \sum_{ij} |Q_{ij}|^2$$

Example: ellipsoidal oscillating charge distribution

$$\Rightarrow Q_{zz} = Q_0, \quad Q_{xx} = Q_{yy} = -Q_0/2 \text{ as } Q_{ii} = 0$$

$$Q_{ij} = 0 \text{ if } i \neq j$$

$$\Rightarrow Q_{ij} n_j Q_{ik} n_k = +\left(\frac{Q_0}{2}\right)^2 (n_x^2 + n_y^2) + Q_0^2 n_z^2 =$$

$$= \frac{Q_0^2}{4} \sin^4 \theta + Q_0^2 \cos^2 \theta$$

$$Q_{ij} n_i n_j = -\frac{Q_0}{2} (n_x^2 + n_y^2) + Q_0 n_z^2 = -\frac{Q_0}{2} \sin^2 \theta + Q_0 \cos^2 \theta$$

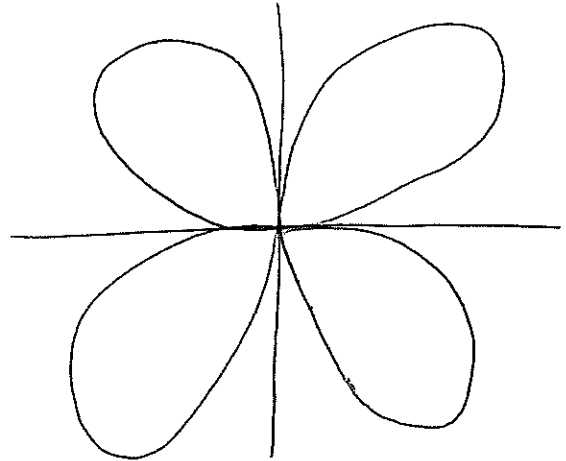

$$\Rightarrow |Q_{ij} n_i n_j|^2 = \frac{Q_0^2}{4} \sin^4 \theta + Q_0^2 \cos^4 \theta - Q_0^2 \sin^2 \theta \cos^2 \theta$$

$$\Rightarrow Q_{ij} n_j Q_{ik} n_k - (Q_{ij} n_i n_j)^2 = \frac{Q_0^2}{4} \sin^2 \theta \cos^2 \theta +$$

$$+ Q_0^2 \sin^2 \theta \cos^2 \theta + \frac{Q_0^2}{4} \sin^2 \theta \cos^2 \theta$$

$$\Rightarrow \frac{dP}{d\Omega} = \frac{ck^6 \cdot q}{2(4\pi\epsilon_0)^2 \epsilon_0} Q_0^2 \sin^2 \theta \cos^2 \theta$$

quadrupole radiation  
pattern:

### Center-Fed Linear Antenna.

In some cases we do not need to expand the vector-potential in the radiation zone:

$$\vec{A} = \frac{\mu_0}{4\pi r} e^{ikr} \int d^3x' \vec{J}(\vec{x}') e^{-ik\hat{n}\cdot\vec{x}'}$$

Consider a center-fed  
linear antenna of length  $d$ :

$$\vec{J} = I \sin\left(\frac{kd}{2} - k|z|\right) \delta(x) \delta(y) \hat{z} \cdot e^{-i\omega t}$$

vanishes at the ends ( $z = \pm d/2$ ).
