

ULTRA SENSITIVE CAVITY RING DOWN SPECTROSCOPY OF MAJOR ATMOSPHERIC SPECIES BETWEEN 1.20 AND 1.71  $\mu\text{m}$

A. CAMPARGUE, S. KASSI, and D. MONDELAIN, *Université Grenoble 1/CNRS, UMR5588 LIPhy, Grenoble, F-38041, France.*

During recent years, we have developed a fibered DFB laser CW-CRDS spectrometer providing routine noise equivalent absorption of  $\alpha_{min} \approx 5 \times 10^{-11} \text{cm}^{-1}$ , over the 5850-8350  $\text{cm}^{-1}$  range. A detection limit of  $\alpha_{min} \approx 5 \times 10^{-13} \text{cm}^{-1}$  has been recently achieved by averaging spectra over a small spectral interval.

The performances of this set up have allowed extending significantly the knowledge of the absorption spectra of molecules of major importance: methane, oxygen, water, ozone, carbon dioxide, hydrogen, nitrogen. The most striking results will be presented.
