

MILLIMETER AND SUB-MILLIMETER SPECTROSCOPY OF CrCCH ($X^6\Sigma^+$)

JIE MIN, LUCY. M. ZIURYS, *Department of Chemistry and Biochemistry, Department of Astronomy, and Steward Observatory, University of Arizona, Tucson, AZ 85721.*

The pure rotational spectrum of CrCCH has been measured using millimeter/sub-millimeter direct absorption methods in the frequency range of 445-485 GHz. The molecule was created in an AC discharge of Cr(CO)₆, acetylene and argon. Six rotational transitions were measured. The spectra clearly indicate that the electronic ground state is a sextet. Spectra of CrCCD have also been recorded using the mixture of Cr(CO)₆, deuterated acetylene and argon in an AC discharge. The data were fit with a Hund's case (b) Hamiltonian and rotational, spin-rotation and spin-spin parameters have been determined. The structure has been calculated based on the rotational constants.
