

FINE-STRUCTURE PREDISSOCIATION OF ULTRACOLD PHOTOASSOCIATED $^{39}\text{K}_2$ MOLECULES

HE WANG, P. L. GOULD and W. C. STWALLEY, *Department of Physics, University of Connecticut, Storrs, CT 06269.*

We report the first observation of fragmentation spectra of the fine-structure predissociated long-range 1_g and 0_u^+ state of ultracold ($T \sim 350\mu\text{K}$) $^{39}\text{K}_2$ molecules. The 1_g state predissociates via the curve crossing at long range with the repulsive 0_g^+ state. The 0_u^+ state, however, predissociates predominantly through molecular fine-structure mixing at short range with the $b^3\Pi_{1u}$ component. Our technique of fragmentation spectroscopy is a sensitive and selective tool for studies of ultracold photoassociation and fine-structure-changing collisions.
