

OBSERVATIONS OF FORMIC ACID TOWARD GALACTIC HOT MOLECULAR CORES

SHENG-YUAN LIU, DAVID M. MEHRINGER, and LEWIS E. SNYDER, *Department of Astronomy, University of Illinois, 1002 W.Green, Urbana, IL 61801.*

Formic acid shares structural elements with the common interstellar molecule methyl formate (HCOOCH_3) and the elusive biomolecule acetic acid (CH_3COOH). It is the simplest organic acid, but it has only been identified in astronomical sources by fairly weak lines in single-element telescope surveys. In order to study the successive formation of biomolecules in the ISM, we carried out a survey of HCOOH toward galactic hot molecular cores with the Berkeley-Illinois-Maryland Association (BIMA) Array. Up to five transitions with rest frequencies near 87 GHz have been detected simultaneously in three sources: Sgr B2(N), Orion, and W51. HCOOH was found to have an excitation temperature of at least 100 K. The formation of HCOOH is probably related to grain-surface chemistry in hot cores. Abundance comparisons with other molecules such as HCOOCH_3 and ethyl cyanide ($\text{C}_2\text{H}_5\text{CN}$) will be discussed.

This work was partially funded by NSF AST96 -13999 and the University of Illinois.
