GOYETTE, University of Massachusetts, Submillimeter Technology Lab, 175 Cabot Street, Lowell, Massachusetts, 01854; B. D. GUENTHER, Physics Department, Duke University, Durham, North Carolina, 27708; FRANK C. DE LUCIA, Department of Physics, The Ohio State University, 174 West 18th Avenue, Columbus, Ohio, 43210.

A Low Temperature Grown GaAs Photo Conductive Switch (LTG GaAs PCS) is employed to demodulate femtosecond pulses from an 800 MHz mode-locked Ti:sapphire laser. The resulting radiation contains the high spectral purity Fourier components of the original pulse train. The current \sim THz bandwidth limitation is due to the 270 femtosecond carrier lifetime in the LTG GaAs. The spectral purity, sources of noise, and system dependence on laser repetition rate will be discussed. Doppler limited rotational spectra at frequencies of \sim 1 THz will be presented.
