Analysis of newly measured spectral data[a] for wave number and intensities of transitions of $^{16}O_2$ in absorption in systems $a\ ^1\Delta_g\ v = 0 - X\ ^3\Sigma_g^-\ v = 0$ and $b\ ^1\Sigma_g^+\ v = 0, 1, 2 - X\ ^3\Sigma_g^-\ v = 0$ with proper statistical treatment yields band parameters for excited states, based on parameters for the ground vibrational state valid up to $J = 41$, that are the most precise ($\sigma = 0.021$, 0.038, 0.043, 0.50 m^{-1} respectively) in published form, and strengths of lines that are internally consistent and in satisfactory agreement with other published values.
