

ANALYSIS OF INTENSITIES OF SPECTRAL FEATURES OF GASEOUS NO IN VIBRATION-ROTATIONAL BAND 6-0 IN ABSORPTION

Y. P. LEE and S. L. CHEAH, *Department of Chemistry, National Tsing Hua University, Hsinchu 30013, Taiwan*; J. F. OGILVIE, *Escuela de Quimica, Universidad de Costa Rica, San Pedro, San Jose, Costa Rica*.

We have detected for the first time the fifth overtone of vibration-rotational transitions of NO in the near infrared region. Despite its small extent of absorption even with an optical path of length 107 m and pressure 10^5 N m⁻² of our sample, we have measured strengths of individual vibration-rotational features, but effects of Λ -doubling were unresolved under those conditions. An electric dipolar moment for the transition and a parameter for the effect of vibration-rotational interaction^a have been quantitatively evaluated.
