

GROUND ELECTRONIC STATES OF Ni-(2,2'-BIPYRIDINE) AND ITS MONOCATION

XU WANG, DONG-SHENG YANG, *Department of Chemistry, University of Kentucky, Lexington, KY, 40605-0055.*

Ni-(2,2'-bipyridine) was produced in a supersonic jet. The electronic spectrum of the complex was measured by using single-photon pulsed field ionization zero electron kinetic energy electron spectroscopy (PFI-ZEKE). The spectrum shows the band origin at 37919(15) cm^{-1} and vibrational intervals of 267, 1035, and 1175 cm^{-1} . With the aid of the B3LYP density functional and Franck-Condon factor calculations, the spectrum is attributed to the vibronic transitions from the 3A_2 ground state of the neutral complex to the 2B_2 ground state of the corresponding ion. The 267 cm^{-1} progression is assigned to the Ni-bipyridine symmetric stretch in the cation, whereas the 1035 and 1175 cm^{-1} intervals arise from ligand-based vibrations.
