# LABORATORY DETECTION AND PURE ROTATIONAL SPECTRUM OF $VCl^+$ BY VELOCITY MODULATION SPECTROSCOPY

D. T. HALFEN and L. M. ZIURYS, *Department of Chemistry, Department of Astronomy, and Steward Observatory, University of Arizona, Tucson, AZ, 85721.*

The pure rotational spectrum of $VCl^+$ has been measured using millimeter-wave direct absorption techniques incorporating velocity modulation for ion selection. This work is the first laboratory observation of this species. $VCl^+$ was created in an AC glow discharge of gas-phase $VCl_4$ and argon. Rotational transitions of the $^{35}Cl$ and $^{37}Cl$ isotopomers have been measured originating in four fine structure components of this ion, each which exhibit hyperfine structure arising from the $^{51}V$ nuclear spin (I = 7/2). The current data suggest a $^4\Phi_r$ or $^4\Delta_r$ ground state. Additional spectroscopic measurements are in progress and the latest results will be presented.
