

AUTOIONIZATION OF HIGH ORBITAL ANGULAR MOMENTUM STATES OF CALCIUM MONOFLUORIDE

JEFFREY J. KAY, DANIEL S. BYUN, JONATHAN R. BARCHI, and ROBERT W. FIELD, *Department of Chemistry, Massachusetts Institute of Technology, Cambridge, MA 02139.*

The use of a double-resonance laser excitation scheme and proper choice of intermediate electronic state has enabled the observation of high orbital angular momentum states of calcium monofluoride with $\ell = 3$ and one or two quanta of core vibrational excitation. These states undergo vibrational autoionization by $\Delta v^+ = 1$ and $\Delta v^+ = 2$ processes. The structure of these states and their observed rates of autoionization are compared with the predictions of the long-range force model of core-nonpenetrating states.
