COLLISIONAL DEPOLARIZATION OF ZEEMAN COHERENCES IN THE $^{133}$Cs $6p^2 P_{3/2}$ LEVEL WITH ARGON MOLECULES: TWO-PHOTON POLARIZATION SPECTROSCOPY

S. B. BAYRAM, S. KIN, M. WELSH and R. MARHATTA, Miami University, Physics Department, Oxford, OH 45056.

An experimental investigation of the Cs $6s^2 S_{1/2} \rightarrow 6p^2 P_{3/2} \rightarrow 10s^2 S_{1/2}$ double resonance two-photon polarization spectrum has been made. In the investigation, a linear polarization degree was measured to extract the alignment depolarization cross section in the cesium $6p^2 P_{3/2}$ level due to collisions between ground-level argon and excited $6p^2 P_{3/2}$ cesium atoms over the Zeeman coherences. The spectra show strong depolarization of the Cs $6p^2 P_{3/2}$ level. The measured alignment depolarization cross section value of 186 (58)$\AA^2$ is in good agreement with experiment and theoretical predictions.
