

PHOTODISSOCIATION STUDIES OF RADICALS: EXPERIMENT

PETER CHEN, LUCA CASTIGLIONI, ANDREAS BACH, *Laboratorium fuer Organische Chemie, ETH Zuerich.*

The photodissociation of hydrocarbon radicals, C₃H₅ and C₂H₅ in particular, is studied by detection of the product hydrogen atom. Action spectra map out the dissociating state. Kinetic energy release as well as the risetime of the atomic hydrogen signal provide dynamical information. The measured dynamics of C₃H₅, initially excited to either the A-state or the C-state, are completely mapped and compare well to predictions of statistical rate theory. The C₂H₅ dissociation dynamics, however, show a marked deviation from RRKM predictions.
