The rotational spectrum of MCN (M=Ag, Au) was observed by employing a source-modulation microwave spectrometer. The MCN species was generated in a dc glow discharge through the mixture of CH<sub>3</sub>CN and Ar by a sputtering reaction with a metal target. The spectrum of MCN was observed in the ground and  $\nu_2$  vibrational excited states. The molecular constants derived from the observed transition frequencies were compared with values of theoretical calculations reported in literature.
