The rotational spectrum of pyridine-tetrafluoromethane has been investigated by molecular beam Fourier transform microwave spectroscopy in a supersonic expansion. The  $\text{CF}_4$  moiety is positioned as a cap over the pyridine nitrogen, and it is freely rotating. For this reason, in the  $m=0$  state, only the pyridine ring is rotating along the  $a$ -axis, and the value of rotational constant  $A'$  is coinciding with that of the constant  $A$  of pyridine. The  $\text{N}\cdots\text{C}_{\text{OF}4}$  distance is  $3.33(2)$  Å. The dissociation energy has been estimated, from the centrifugal distortion, to be ca.  $10$  kJ/mol.
