

OBSERVATIONS OF FORMALDEHYDE AND RELATED ATMOSPHERIC SPECIES USING MULTI-AXIS SPECTROSCOPY

CHRISTOPHER P. BEEKMAN and HEATHER C. ALLEN, *Department of Chemistry, The Ohio State University, Columbus, OH 43210.*

Formaldehyde and the related photo-oxidant species ozone and nitrogen dioxide were monitored using multi-axis differential spectroscopy within the urbanized region of Central Ohio. These data were used to determine source strengths, vertical profiles, and seasonal variation of NO_x/VOC driven photochemistry in the region. Previous studies of VOC emissions in the Central Ohio area have shown a strong correlation between VOC concentrations and automobile emissions. Model results and developed statistical analysis methods will be discussed.
