

STUDY OF SOLVENT DEPENDENT EXCITED STATE ENERGY FLOW IN DANS PROBED WITH ULTRAFAST FS/PS-CARS

MIKHAIL N. SLIPCHENKO, BENJAMIN D. PRINCE, BETH M. PRINCE, ALEX J. BLOM, AND HANS U. STAUFFER, *Department of Chemistry, Iowa State University, Ames, IA 50011-3111.*

The S_1 excited state vibrational dynamics of *trans*-4-dimethylamino-4'-nitrostilbene (DANS) in the 1000 cm^{-1} to 1700 cm^{-1} frequency range are probed in two polar solvents using fs/ps-CARS. The vibrational dynamics of excited state DANS are slower in propylene carbonate *vs.* acetonitrile, which could be attributed to the twice larger dielectric constant and larger viscosity of propylene carbonate. The dynamics of the NO_2 symmetric stretch band around 1300 cm^{-1} are different from other bands, consistent with the current picture of twisted intramolecular charge transfer in DANS.
