

DEVELOPMENTS IN FAST SCAN SUBMILLIMETER SPECTROSCOPIC TECHNIQUE (FASSST) AND COMPUTER AIDED ASSIGNMENT OF ASYMMETRIC ROTOR SPPECTRA (CAAARS) SOFTWARE SUITE.

IVAN R. MEDVEDEV AND FRANK C. DE LUCIA, *Department of Physics, The Ohio State University, Columbus, OH 43210-1106, USA*; PAUL HELMINGER, *Department of Physics, University of South Alabama, Mobile, AL 36688*.

Most molecules of astrophysical, chemical, and environmental importance exhibit strong maxima in their interaction strengths with electromagnetic radiation in the millimeter and sub-millimeter spectral range. Over the past decade or so, we have developed the Fast Scan Submillimeter Spectroscopic Technique (FASSST)^{a b}, which makes possible rapid interrogation of a large number of ro-vibrational transitions. We have also developed automated approaches for the analysis of the resulting large spectral data sets, most notable of these being CAAARS^c (Computer Aided Assignment of Asymmetric Rotor Spectra). This work has been a process of continual enhancement of both hardware and software. In this talk we will describe the current state-of-the art for this hardware/software combination, recent extensions, and potential future enhancements. This will include a multiplier based extension of the spectral range based on the more well behaved lower frequency BWOs. Recent spectroscopic work will be used to illustrate the characteristics of the system.
