

# LING3701/PSYCH3371: Lecture Notes 15

## Learning Words

Until now we've looked at what language is and how it works.

Now we ask: how do babies learn it? (The short answer is: statistics!)

### Contents

15.1 Acquisition of word segmentation [Saffran, 2001] . . . . .	1

### 15.1 Acquisition of word segmentation [Saffran, 2001]

[Saffran, 2001]: infants learn words in context

- **subjects:** infants aged 7m,3w to 8m,2w
- **stimuli:** synthesized sequences of 180 nonsense words:
  - '*bidaku padoti golabu bidaku ...*' (+ random lights, for interest)

$$P(\text{do} \mid \text{pa}) = 1, \quad P(\text{ti} \mid \text{do}) = 1, \quad P(\text{pa} \mid \text{ku}) = .33$$

then:

1. central light until fixation;
2. side light until fixation;
3. side light and audio until look away:
  - (a) '*I like my padoti*' (English context with 'word')
  - (b) '*I like my kupado*' (English context with non-'word')
  - (c) '*zy fike ny padoti*' (Nonsense context with 'word')
  - (d) '*zy fike ny kupado*' (Nonsense context with non-'word')

- **measure:** side light fixation time
- **results:** subjects prefer (look longer at) 'words' in English,  
subjects prefer non-words in Nonsense context
