7.1 Event sequences can be hierarchic

We may observe some events with sub-structure:

7.2 Sub-sequence probabilities

We can define probabilities over hierarchic event sequences using a stochastic branching process.

Probabilities are of sequence of subordinate ‘child’ types given a superordinate ‘parent’ type:

- $P(\text{coffee-in-mug} \rightarrow \text{mug-on-tray cup-in-machine fill-tank push-button} \mid \text{coffee-in-mug}) = 0.33$
- $P(\text{coffee-in-mug} \rightarrow \text{mug-on-tray cup-in-machine push-button} \mid \text{coffee-in-mug}) = 0.67$
- $P(\text{fill-tank} \rightarrow \text{tank-in-hand faucet-on tank-under-tap} \mid \text{fill-tank}) = 1.0$
- $P(\text{mug-on-tray} \rightarrow (\text{observed}) \mid \text{mug-on-tray}) = 1.0$

- $P(\text{cup-in-machine} \rightarrow (\text{observed}) | \text{cup-in-machine}) = 1.0$
- $P(\text{tank-in-hand} \rightarrow (\text{observed}) | \text{tank-in-hand}) = 1.0$
- $P(\text{faucet-on} \rightarrow (\text{observed}) | \text{faucet-on}) = 1.0$
- $P(\text{tank-under-tap} \rightarrow (\text{observed}) | \text{tank-under-tap}) = 1.0$
- $P(\text{push-button} \rightarrow (\text{observed}) | \text{push-button}) = 1.0$

These probabilities can be estimated from data, e.g. the trees above.

7.3 Joint probabilities of event sequences

A ‘joint’ probability for the entire set of trees can then be estimated as the product of all used rules:

$$.33 \times .67 \times .67 \times 1.0 \times 1.0 \times 1.0 \times 1.0 \times 1.0 \times 1.0 = 0.1481$$

7.4 Practice

1. Calculate a probabilistic grammar based on the below evidence:

2. Calculate a probabilistic grammar based on the below evidence:

7.5 Practice

Which of the tree sets in the above problem has a lower probability?
