## Chapter 20

## Electrochemistry

## Electrochemical Cell

Consists of electrodes which dip into an electrolyte \& in which a chem. rxn. uses or generates an electric current

## Voltaic (Galvanic) Cell

Spont. rxn. - produces electrical energy

- current supplied to external circuit

## Electrolytic Cell

electrical energy is used to drive an otherwise nonspont. rxn.

## I) Oxidation - Reduction Rx's (Redox)

Involves loss of $\mathrm{e}^{-}$by one element \& gain of $\mathrm{e}^{-}$by another element

Oxidation: lose $\mathrm{e}^{-}$
(inc. in oxidation \#)
Reduction: gain $\mathrm{e}^{-}$
(dec. in oxidation \#)

Oxidizing agent: substance that (oxidant) is reduced

Reducing agent: (reductant)
substance that
is oxidized

## $\mathrm{Zn}+\mathrm{Br}_{2} \longrightarrow \mathrm{ZnBr}_{2}$

Zn lost $\mathrm{e}^{-} \Rightarrow$ oxidized

Br gained $\mathrm{e}^{-} \Rightarrow$ reduced

## A) Oxidation Numbers

"Charge" an atom would have if both $\mathrm{e}^{-}$in each bond are assigned to the more electronegative atom.

## 1) Elemental Form

$$
\begin{aligned}
& \mathrm{Cu}, \quad \mathrm{H}_{2}, \quad \mathrm{O}_{2}, \quad \mathrm{~S}_{8} \\
& \text { ox. } \#=0 \quad \text { (zero) }
\end{aligned}
$$

2) Monatomic Ion

$$
\left.\begin{array}{l}
\text { ox. \# }=\text { charge } \\
\mathrm{Na}^{+}, \mathrm{Zn}^{2+}, \mathrm{Al}^{3+}, \mathrm{O}^{2-}, \mathrm{Br}^{-} \\
\text {Group IA } \Rightarrow+1 \\
\text { Group IIA } \Rightarrow+2 \\
\text { (Always) } \\
\text { Group IIIA } \Rightarrow+3
\end{array} \quad \text { (Always) } \text { (usually) }\right) ~ l
$$

3) Hydrogen

## $\mathrm{H} \Rightarrow+1 \quad$ (usually)

## exceptions

$$
\begin{aligned}
& \text { hydrides, } \mathrm{H} \Rightarrow-1 \\
& \mathrm{NaH}, \mathrm{CaH}_{2}
\end{aligned}
$$

4) Oxygen

$$
\mathrm{O} \Rightarrow-2 \text { (usually) }
$$

## exceptions

peroxides, $\mathrm{O}_{2}{ }^{2-} \quad \mathrm{O} \Rightarrow-1$

$$
\mathrm{H}_{2} \mathrm{O}_{2} \quad \mathrm{Na}_{2} \mathrm{O}_{2}
$$

superoxides, $\mathrm{O}_{2}{ }^{\mathbf{1 -}} \mathrm{O} \Rightarrow-1 / 2$
$\mathrm{KO}_{2}$
5) Fluorine

$$
F \Rightarrow-1 \quad \text { Always }
$$

6) Halogens: $\mathrm{Cl}, \mathrm{Br}, \mathrm{I}$
-1 except when combined w. a more E.N. element
$\mathrm{CBr}_{4}$ : $\mathrm{Br} \Rightarrow-1$
can be : $-1,0,+1,+3,+5,+7$

$$
\mathrm{ClO}_{4}^{-}:+7
$$

# 7) Sum of ox. no.'s of atoms in neutral cmpds. $=$ 

$$
0 \text { (zero) }
$$

8) Sum of ox. no.'s of atoms in a polyatomic ion = charge
9) Ox. no. can not be:
more positive than the group \# or
more negative than (group \# - 8)
B) Examples
10) Ex 1: What is ox. \# of N in $\mathrm{NH}_{3}$ ?
$\# x_{\mathrm{N}}+3(+1)=0$

$$
\# x_{\mathrm{N}}=-3
$$

2) Ex 2: What is ox. \# of N in $\mathrm{NO}_{3}^{-}$?
$\# x_{\mathrm{N}}+3(-2)=-1$
$\# x_{\mathrm{N}}=+5$
3) Ex 3: What is ox. \# of N in $\mathrm{NO}_{2}^{-}$?
$\# x_{\mathrm{N}}+2(-2)=-1$
$\# x_{\mathrm{N}}=+3$
4) Ex 4: What is ox. \# of Xe in $\mathrm{XeOF}_{4}$ ?

## 5) Ex 5: <br> What is ox. \# of Cr in $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ ?

## C) Redox Reactions

# Involves transfer of $\mathrm{e}^{-}$between species or change in ox. \# of atoms 

Oxidation: inc. in ox. \#
(lose e ${ }^{-}$)
Reduction:
dec. in ox. \#

$$
\text { (gain e }{ }^{-} \text {) }
$$

1) Ex 1: Combustion
$\mathrm{CH}_{4}+2 \mathrm{O}_{2} \longrightarrow \mathrm{CO}_{2}+2 \mathrm{H}_{2} \mathrm{O}$
2) Ex 2: What is being oxidized and reduced? What is the oxidizing agent and reducing agent? How many electrons are transferred?
$\mathrm{P}_{4}+10 \mathrm{HClO}+\mathrm{H}_{2} \mathrm{O} \longrightarrow 4 \mathrm{H}_{3} \mathrm{PO}_{4}+10 \mathrm{HCl}$

## II) Balancing Redox Reactions

A) Half-Reaction Method
focus on ox. \& red. process separately

\# $\mathrm{e}^{-}$lost in<br>\# $\mathrm{e}^{-}$gained in<br>ox. half-rx. red. half-rx.

## 1) Write eqn. in net ionic form

 Skeleton Eqn.
## 2) Write 2 half-rx. - one for

 ox. \& one for red.3) Determine coef. req. to balance atoms other than H \& O
4) Bal. O atoms by adding $\mathrm{H}_{2} \mathrm{O}$ to side needing O atoms
5) $\mathrm{Bal} . \mathrm{H}$ atoms by adding $\mathrm{H}^{+}$ to side needing H atoms

Acidic soln.
6) Bal. charge in each eqn. by adding $\mathrm{e}^{-}$to more (+) side
red. $1 / 2-r x=>e^{-}$on reactant side
ox. $1 / 2-\mathrm{rx}=>\mathrm{e}^{-}$on product side
7) Multiply each $1 / 2-r x$ by factor so:
total \# e ${ }^{-}$lost $=$total $\# \mathrm{e}^{-}$gained

7a) If run. in basic soln., add $\mathrm{OH}^{-}$to both sides of $1 / 2$-rxs. to neutralize $\mathrm{H}^{+}$

## Cancel $\mathrm{H}_{2} \mathrm{O}$ as needed.

8) Add $1 ⁄ 2$-rx \& cancel $\mathrm{e}^{-} \&$ other species common to both sides of eq.
B) Ex 1: Bal. following redox eqn. in acidic soln.
$\mathrm{Pt}+\mathrm{NO}_{3}^{-}+\mathrm{Cl}^{-} \longrightarrow \mathrm{PtCl}_{6}^{2-}+\mathrm{NO}$ (acidic)

$$
\text { 1) Step } 2 \text { - divide into } 1 / 2 \text {-rx. }
$$

$\mathrm{Pt}+\mathrm{Cl}^{-} \longrightarrow \mathrm{PtCl}_{6}{ }^{2-}$ (ox.)

$$
\mathrm{NO}_{3}^{-} \longrightarrow \mathrm{NO} \quad \text { (red.) }
$$

2) Step 3 - bal. atoms other than O \& H

$$
\mathrm{Pt}+\mathrm{Cl}^{-} \longrightarrow \mathrm{PtCl}_{6}^{2-}
$$

3) Steps 4 \& $5-$ Bal. O \& H
$\mathrm{NO}_{3}{ }^{-}+\quad \longrightarrow \mathrm{NO}+$
4) Step 6 - Bal. Charge
$\mathrm{Pt}+6 \mathrm{Cl}^{-} \longrightarrow \mathrm{PtCl}_{6}{ }^{2-}$
$\mathrm{NO}_{3}^{-}+4 \mathrm{H}^{+} \quad \longrightarrow \mathrm{NO}+2 \mathrm{H}_{2} \mathrm{O}$
5) Step 7 - Multiply by factors so \# $\mathrm{e}^{-}$lost $=$\# $\mathrm{e}^{-}$gained
$\left(\mathrm{Pt}+6 \mathrm{Cl}^{-} \longrightarrow \mathrm{PtCl}_{6}{ }^{2-}+4 \mathrm{e}^{-}\right)$
$\left(\mathrm{NO}_{3}^{-}+4 \mathrm{H}^{+}+3 \mathrm{e}^{-} \longrightarrow \mathrm{NO}+2 \mathrm{H}_{2} \mathrm{O}\right)$
$\mathrm{Pt}+\mathrm{Cl}^{-} \longrightarrow \mathrm{PtCl}_{6}^{2-}+\mathrm{e}^{-}$
$\mathrm{NO}_{3}^{-}+\mathrm{H}^{+}+\mathrm{e}^{-} \longrightarrow \mathrm{NO}+\mathrm{H}_{2} \mathrm{O}$
6) Step 8 - Add eqns \& cancel
$\mathrm{Pt}+\mathrm{Cl}^{-}+\mathrm{NO}_{3}{ }^{-}+\mathrm{H}^{+}$
$\mathrm{PtCl}_{6}^{2-}+\mathrm{NO}+\mathrm{H}_{2} \mathrm{O}$
C) Ex 2: Bal. following redox eqn. in basic soln.
$\mathrm{MnO}_{4}^{-}+\mathrm{Br}^{-} \longrightarrow \mathrm{MnO}_{2}+\mathrm{Br}_{2} \quad$ (basic)

## III) Voltaic (Galvanic) Cells

Consists of 2 half-cells connected by an external circuit.

## Half-cell

portion of an electrochem. cell in which a $1 / 2$-rx occurs
$\mathrm{Zn}(\mathrm{s})+\mathrm{Cu}^{2+}(\mathrm{aq}) \longrightarrow \mathrm{Zn}^{2+}(\mathrm{aq})+\mathrm{Cu}(\mathrm{s})$

Cell rxn : net rxn. which occurs in the voltaic cell

Fig. 20.6 Terminology Used in Describing Voltaic Cell

A) Half-cell Rxns

## 1) Anode (-)

Anode: electrode at which ox. occurs
ox. half-rx
$\mathrm{Zn}(\mathrm{s}) \longrightarrow \mathrm{Zn}^{2+}(\mathrm{aq})+2 \mathrm{e}^{-}$
$\mathrm{Zn}^{2+}$ ions produced at electrode

- move away leaving e- behind
$\mathrm{e}^{-}$flow out of anode
(towards the cathode)

2) Cathode (+)

Cathode: electrode at which red. occurs
red. half-rx
$\mathrm{Cu}^{2+}(\mathrm{aq})+2 \mathrm{e}^{-} \longrightarrow \mathrm{Cu}(\mathrm{s})$
$\mathrm{Cu}^{2+}$ ions discharged at electrode

- removes $\mathrm{e}^{-}$from electrode
$\mathrm{e}^{-}$flow into the cathode (appears to attract $\mathrm{e}^{-}$)

Soln. on right has a - chg.
Soln. on left has a + chg.
anions must move from

$$
\text { lt. } \longleftarrow \mathrm{rt.}
$$

Accomplishes 2 things

> 1) Carry chg.
2) Preserves electrical neutrality

Salt Bridge
tube of electrolyte in a gel connected to the half-cells

> - allows flow of ions but prevents mixing of the diff. solns.
B) Cell Notation

Shorthand description of cell

1) Ions in soln.

$$
\begin{gathered}
\mathrm{Zn}(\mathrm{~s})\left|\mathrm{Zn}^{2+}(\mathrm{aq}) \| \mathrm{Cu}^{2+}(\mathrm{aq})\right| \mathrm{Cu}(\mathrm{~s}) \\
\text { anode } \begin{array}{c}
\text { salt } \\
\text { bridge }
\end{array} \quad \text { cathode } \\
\mid \text { vertical line is a phase boundary }
\end{gathered}
$$

## 2) Gaseous Reactant or Product

use inert electrode
$\mathrm{Zn}(\mathrm{s})\left|\mathrm{Zn}^{2+}(\mathrm{aq}) \| \mathrm{Cl}_{2}(\mathrm{~g})\right| \mathrm{Cl}^{-}(\mathrm{aq}) \mid \mathrm{Pt}$
anode $\begin{gathered}\text { salt } \\ \text { bridge }\end{gathered}$
anode :
cathode :

## 3) Ions in Diff. Ox. States

use inert electrode
$\operatorname{Sn}(\mathrm{s})\left|\operatorname{Sn}^{2+}(\mathrm{aq}) \| \operatorname{Sn}^{4+}(\mathrm{aq}), \mathrm{Sn}^{2+}(\mathrm{aq})\right| \mathrm{Pt}$
anode $\begin{gathered}\text { salt } \\ \text { bridge }\end{gathered}$
anode :
cathode :

## IV) Standard Cell (Electrode) Potentials

A) Electromotive Force

Work req. to move a charge from a region of low electric pot. energy to a region of high electric pot. energy.
$\mathrm{w}=$ charge $\times \Delta$ P.E.
Joules $=$ Coulombs • Volts

$$
1 \mathrm{~J}=1 \mathrm{C} \cdot \mathrm{~V}
$$

$\Delta$ P.E. (V) : diff. in electric potential between 2 points
work done by a voltaic cell to move n moles of $\mathrm{e}^{-}$is given by:

$$
\mathrm{w}_{\max }=-\mathrm{nF} \mathrm{E}_{\mathrm{cell}}
$$

F : faraday constant, $9.65 \times 10^{4} \mathrm{C}$ charge on 1 mole of $\mathrm{e}^{-}$
$\mathrm{E}_{\text {cell }}$ : electromotive force (emf)

## max. potential diff. between electrodes of a cell

$$
\Delta \mathrm{G}=-\mathrm{nF} \mathrm{E}_{\mathrm{cell}}
$$

NOTE: Spont. rxn.
$\Delta \mathrm{G}<0 \quad \mathrm{E}_{\text {cell }}>0$

## B) Cell (Electrode) Potentials

$$
\begin{aligned}
E_{\text {cell }} & =E_{\text {red }}+E_{\text {ox }} \\
E_{\text {ox }} & =-E_{\text {red }} \text { for reverse run. }
\end{aligned}
$$

Tabulate reduction pot. called electrode pot., $\mathrm{E}_{\text {red }}$

$$
\mathrm{Zn}(\mathrm{~s}) \longrightarrow \mathrm{Zn}^{2+}(\mathrm{aq})+2 \mathrm{e}^{-} \quad \mathrm{E}_{\mathrm{ox}}=-\mathrm{E}_{\mathrm{Zn}}
$$

$$
\mathrm{Cu}^{2+}(\mathrm{aq})+2 \mathrm{e}^{-} \longrightarrow \mathrm{Cu}(\mathrm{~s}) \quad \mathrm{E}_{\mathrm{red}}=\mathrm{E}_{\mathrm{Cu}}
$$

$$
\mathrm{E}_{\text {cell }}=\mathrm{E}_{\mathrm{Cu}}+\left(-\mathrm{E}_{\mathrm{Zn}}\right)
$$

$$
=\mathrm{E}_{\mathrm{Cu}}-\mathrm{E}_{\mathrm{Zn}}
$$

$$
\mathrm{E}_{\text {cell }}=\mathrm{E}_{\text {cathode }}-\mathrm{E}_{\text {anode }}
$$

# C) Standard Reduction Potentials 

## Standard emf: $\mathrm{E}_{\text {cell }}^{0}$

emf of a cell under standard-state conditions

## Standard reduction pot. $\mathrm{E}_{\text {red }}^{0}$

 reduction (electrode) pot. when conc. of solutes are $1 \mathrm{M} \&$ gas pressures are 1 atm , at a specified temp.- measured relative to a reference electrode
- standard H electrode (SHE)
$2 \mathrm{H}^{+}(\mathrm{aq})+2 \mathrm{e}^{-} \longrightarrow \mathrm{H}_{2}(\mathrm{~g})$

$$
\mathrm{E}_{\mathrm{H}_{2}}^{\mathrm{o}}=0.00 \mathrm{~V}
$$

More
positive

More
negative

TABLE 20.1 • Standard Reduction Potentials in Water at $25^{\circ} \mathrm{C}$

| $\boldsymbol{E}_{\text {red }}^{\circ}(\mathbf{V})$ | Reduction Half-Reaction |
| :--- | :--- |
| +2.87 | $\mathrm{~F}_{2}(g)+2 \mathrm{e}^{-} \longrightarrow 2 \mathrm{~F}^{-}(a q)$ |
| +1.51 | $\mathrm{MnO}_{4}^{-}(a q)+8 \mathrm{H}^{+}(a q)+5 \mathrm{e}^{-} \longrightarrow \mathrm{Mn}^{2+}(a q)+4 \mathrm{H}_{2} \mathrm{O}(l)$ |
| +1.36 | $\mathrm{Cl}_{2}(g)+2 \mathrm{e}^{-} \longrightarrow 2 \mathrm{Cl}^{-}(a q)$ |
| +1.33 | $\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}(a q)+14 \mathrm{H}^{+}(a q)+6 \mathrm{e}^{-} \longrightarrow 2 \mathrm{Cr}^{3+}(a q)+7 \mathrm{H}_{2} \mathrm{O}(l)$ |
| +1.23 | $\mathrm{O}_{2}(g)+4 \mathrm{H}^{+}(a q)+4 \mathrm{e}^{-} \longrightarrow 2 \mathrm{H}_{2} \mathrm{O}(l)$ |
| +1.06 | $\mathrm{Br}_{2}(l)+2 \mathrm{e}^{-} \longrightarrow 2 \mathrm{Br}^{-}(a q)$ |
| +0.96 | $\mathrm{NO}_{3}{ }^{-}(a q)+4 \mathrm{H}^{+}(a q)+3 \mathrm{e}^{-} \longrightarrow \mathrm{NO}(g)+2 \mathrm{H}_{2} \mathrm{O}(l)$ |
| +0.80 | $\mathrm{Ag}^{+}(a q)+\mathrm{e}^{-} \longrightarrow \mathrm{Ag}^{-}(s)$ |
| +0.77 | $\mathrm{Fe}^{3+}(a q)+\mathrm{e}^{-} \longrightarrow \mathrm{Fe}^{2+}(a q)$ |
| +0.68 | $\mathrm{O}_{2}(g)+2 \mathrm{H}^{+}(a q)+2 \mathrm{e}^{-} \longrightarrow \mathrm{H}_{2} \mathrm{O}_{2}(a q)$ |
| +0.59 | $\mathrm{MnO}_{4}^{-}(a q)+2 \mathrm{H}_{2} \mathrm{O}(l)+3 \mathrm{e}^{-} \longrightarrow \mathrm{MnO}_{2}(s)+4 \mathrm{OH}^{-}(a q)$ |
| +0.54 | $\mathrm{I}_{2}(s)+2 \mathrm{e}^{-} \longrightarrow 2 \mathrm{I}^{-}(a q)$ |
| +0.40 | $\mathrm{O}_{2}(g)+2 \mathrm{H}_{2} \mathrm{O}(l)+4 \mathrm{e}^{-} \longrightarrow 4 \mathrm{OH}^{-}(a q)$ |
| +0.34 | $\mathrm{Cu}^{2+}(a q)+2 \mathrm{e}^{-} \longrightarrow \mathrm{Cu}(s)$ |
| $0[$ defined $]$ | $2 \mathrm{H}^{+}(a q)+2 \mathrm{e}^{-} \longrightarrow \mathrm{H}(g)$ |
| -0.28 | $\mathrm{Ni}^{2+}(a q)+2 \mathrm{e}^{-} \longrightarrow \mathrm{Ni}(s)$ |
| -0.44 | $\mathrm{Fe}^{2+}(a q)+2 \mathrm{e}^{-} \longrightarrow \mathrm{Fe}(s)$ |
| -0.76 | $\mathrm{Zn}^{2+}(a q)+2 \mathrm{e}^{-} \longrightarrow \mathrm{Zn}(s)$ |
| -0.83 | $2 \mathrm{H}_{2} \mathrm{O}(l)+2 \mathrm{e}^{-} \longrightarrow \mathrm{H}_{2}(g)+2 \mathrm{OH}^{-}(a q)$ |
| -1.66 | $\mathrm{Al}^{3+}(a q)+3 \mathrm{e}^{-} \longrightarrow \mathrm{Al}(s)$ |
| -2.71 | $\mathrm{Na}^{+}(a q)+\mathrm{e}^{-} \longrightarrow \mathrm{Na}(s)$ |
| -3.05 | $\mathrm{Li}^{+}(a q)+\mathrm{e}^{-} \longrightarrow \mathrm{Li}(s)$ |

# D) Strengths of Ox. \& Red. Agents 

Arranged in table w. greatest tendency for red. at top

Strongest ox. agents are at the upper left $\left(\mathrm{F}_{2}, \mathrm{~S}_{2} \mathrm{O}_{8}{ }^{2-}, \mathrm{H}_{2} \mathrm{O}_{2}\right)$

Strongest red. agents are at the lower right (Li, $\mathrm{Na}, \mathrm{Mg}, \mathrm{Al}$ )

Note
For a spont. rxn the stronger ox. \& red. agents will be the reactants

Most negative values of $E_{\text {red }}^{\circ}$
© 2012 Pearson Education, Inc.

TABLE 20.1 - Standard Reduction Potentials in Water at $25^{\circ} \mathrm{C}$

| $\boldsymbol{E}_{\text {red }}^{\circ}(\mathbf{V})$ | Reduction Half-Reaction |
| :--- | :--- |
| +2.87 | $\mathrm{~F}_{2}(g)+2 \mathrm{e}^{-} \longrightarrow 2 \mathrm{~F}^{-}(a q)$ |
| +1.51 | $\mathrm{MnO}_{4}^{-}(a q)+8 \mathrm{H}^{+}(a q)+5 \mathrm{e}^{-} \longrightarrow \mathrm{Mn}^{2+}(a q)+4 \mathrm{H}_{2} \mathrm{O}(l)$ |
| +1.36 | $\mathrm{Cl}_{2}(g)+2 \mathrm{e}^{-} \longrightarrow 2 \mathrm{Cl}^{-}(a q)$ |
| +1.33 | $\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}(a q)+14 \mathrm{H}^{+}(a q)+6 \mathrm{e}^{-} \longrightarrow 2 \mathrm{Cr}^{3+}(a q)+7 \mathrm{H}_{2} \mathrm{O}(l)$ |
| +1.23 | $\mathrm{O}_{2}(g)+4 \mathrm{H}^{+}(a q)+4 \mathrm{e}^{-} \longrightarrow 2 \mathrm{H}_{2} \mathrm{O}(l)$ |
| +1.06 | $\mathrm{Br}_{2}(l)+2 \mathrm{e}^{-} \longrightarrow 2 \mathrm{Br}^{-}(a q)$ |
| +0.96 | $\mathrm{NO}_{3}^{-}(a q)+4 \mathrm{H}^{+}(a q)+3 \mathrm{e}^{-} \longrightarrow \mathrm{NO}(g)+2 \mathrm{H}_{2} \mathrm{O}(l)$ |
| +0.80 | $\mathrm{Ag}^{+}(a q)+\mathrm{e}^{-} \longrightarrow \mathrm{Ag}(s)^{+0.77}$ |
| +0.68 | $\mathrm{Fe}^{3+}(a q)+\mathrm{e}^{-} \longrightarrow \mathrm{Fe}^{2+}(a q)$ |
| +0.59 | $\mathrm{O}_{2}(g)+2 \mathrm{H}^{+}(a q)+2 \mathrm{e}^{-} \longrightarrow \mathrm{H}_{2} \mathrm{O}_{2}(a q)$ |
| +0.54 | $\mathrm{MnO}_{4}^{-}(a q)+2 \mathrm{H}_{2} \mathrm{O}(l)+3 \mathrm{e}^{-} \longrightarrow \mathrm{MnO}_{2}(s)+4 \mathrm{OH}^{-}(a q)$ |
| +0.40 | $\mathrm{I}_{2}(s)+2 \mathrm{e}^{-} \longrightarrow 2 \mathrm{I}^{-}(a q)$ |
| +0.34 | $\mathrm{O}_{2}(g)+2 \mathrm{H}_{2} \mathrm{O}(l)+4 \mathrm{e}^{-} \longrightarrow 4 \mathrm{OH}^{-}(a q)$ |
| $0[$ defined $]$ | $\mathrm{Cu}^{2+}(a q)+2 \mathrm{e}^{-} \longrightarrow \mathrm{Cu}(s)$ |
| -0.28 | $2 \mathrm{H}^{+}(a q)+2 \mathrm{e}^{-} \longrightarrow \mathrm{H} \mathrm{H}_{2}(g)$ |
| -0.44 | $\mathrm{Ni}^{2+}(a q)+2 \mathrm{e}^{-} \longrightarrow \mathrm{Ni}(s)$ |
| -0.76 | $\mathrm{Fe}^{2+}(a q)+2 \mathrm{e}^{-} \longrightarrow \mathrm{Fe}(s)$ |
| -0.83 | $\mathrm{Zn}^{2+}(a q)+2 \mathrm{e}^{-} \longrightarrow \mathrm{Zn}(s)$ |
| -1.66 | $2 \mathrm{H}_{2} \mathrm{O}(l)+2 \mathrm{e}^{-} \longrightarrow \mathrm{H}_{2}(g)+2 \mathrm{OH}^{-}(a q)$ |
| -2.71 | $\mathrm{Al}^{3+}(a q)+3 \mathrm{e}^{-} \longrightarrow \mathrm{Al}(s)$ |
| -3.05 | $\mathrm{Na}^{+}(a q)+\mathrm{e}^{-} \longrightarrow \mathrm{Na}(s)$ |

1) Ex 1 : Which will be the stronger red. agent under standard conditions, $\mathrm{Sn}^{2+}$ (to $\mathrm{Sn}^{4+}$ ) or $\mathrm{Fe}\left(\right.$ to $\mathrm{Fe}^{2+}$ )
$\mathrm{E}_{\text {red }}^{0}$ (V)
$\mathrm{Sn}^{4+}(\mathrm{aq})+2 \mathrm{e}^{-} \longrightarrow \mathrm{Sn}^{2+}(\mathrm{aq}) \quad+0.154$
$\mathrm{Fe}^{2+}(\mathrm{aq})+2 \mathrm{e}^{-} \longrightarrow \mathrm{Fe}(\mathrm{s}) \quad-0.440$

## E) Calc. Cell emf's from Std. Pot.

## $\mathrm{E}_{\text {red }}^{0}(\mathrm{~V})$

$\mathrm{Pb}^{2+}(\mathrm{aq})+2 \mathrm{e}^{-} \longrightarrow \mathrm{Pb}(\mathrm{s}) \quad-0.13$
$\mathrm{Ag}^{+}(\mathrm{aq})+\mathrm{e}^{-} \longrightarrow \operatorname{Ag}(\mathrm{s}) \quad+0.80$

1) run. is spont. w. stronger red. agent (one most easily ox.) on left (as reactant), Pb

Reverse of Pb electrode rn.

NOTE: For a voltaic cell the cathode must be run. w. more $+\mathrm{E}_{\text {red }}^{\circ}$ - Ag electrode in this case
$\mathrm{Pb}(\mathrm{s}) \longrightarrow \mathrm{Pb}^{2+}(\mathrm{aq})+2 \mathrm{e}^{-}$
$\mathrm{Ag}^{+}(\mathrm{aq})+\mathrm{e}^{-} \longrightarrow \mathrm{Ag}(\mathrm{s})$

## 2) Multiply run. 2 (Ag run) by 2 to balance the $\mathrm{e}^{-}$

$\mathrm{E}_{\text {red }}^{o}$ NOT multiplied by factor

- intensive quantity
$\mathrm{Pb}(\mathrm{s}) \longrightarrow \mathrm{Pb}^{2+}(\mathrm{aq})+2 \mathrm{e}^{-}$
$2 \mathrm{Ag}^{+}(\mathrm{aq})+2 \mathrm{e}^{-} \longrightarrow 2 \mathrm{Ag}(\mathrm{s})$

3) Add eqns to get overall cell run
$\mathrm{Pb}(\mathrm{s})+2 \mathrm{Ag}^{+}(\mathrm{aq}) \longrightarrow \mathrm{Pb}^{2+}(\mathrm{aq})+2 \mathrm{Ag}(\mathrm{s})$
$\mathrm{Pb}(\mathrm{s})\left|\mathrm{Pb}^{2+}(\mathrm{aq}) \| \mathrm{Ag}^{+}(\mathrm{aq})\right| \mathrm{Ag}(\mathrm{s})$

## 4) Calc. cell potential, $E_{\text {cell }}^{\circ}$

$$
\begin{aligned}
\mathrm{E}_{\text {cell }}^{\circ} & =\mathrm{E}_{\text {cathode }}^{\circ}-\mathrm{E}_{\text {anode }}^{\mathrm{o}} \\
& =\mathrm{E}_{\mathrm{Ag}}^{\mathrm{o}}-\mathrm{E}_{\mathrm{Pb}}^{\circ}
\end{aligned}
$$

II) Equilibrium Constants from emf's

$$
\Delta G^{\circ}=-n F E_{\text {cell }}^{\circ}
$$

Also,

$$
\begin{aligned}
& \Delta G^{\circ}=-R T \ln K \\
& \therefore \quad n F E_{\text {cell }}^{0}=R T \ln K \\
& E_{\text {cell }}^{0}=\frac{R T}{n F} \ln K \\
& \text { or } \\
& E_{\text {cell }}^{0}=\frac{2.303 R T}{n F} \log K
\end{aligned}
$$

At $25^{\circ} \mathrm{C}$

$$
E_{\text {cell }}^{\circ}=\frac{0.0592}{n} \log K \quad \text { (in volts) }
$$

A) Ex's

1) Calc. $A G^{\circ}$ at $25^{\circ} \mathrm{C}$ for the $\mathrm{Pb}-\mathrm{Ag}$ cell.

$$
\Delta G^{0}=-n F E^{0}
$$

2) Calc. the equil. constant $K$.

$$
E_{\text {cell }}^{0}=\frac{0.0592}{n} \log K
$$

B) Ex 2 : What are $\Delta G^{\circ}$ and $K$ for the following cell?

$$
\begin{aligned}
& A l(s) / A l^{3+}(\text { aq }) / / P_{b}^{2+}(\text { aq }) / P b(s) \\
& \mathrm{Al}^{3+}+3 e^{-} \longrightarrow A l \\
& -\frac{E^{\circ}}{-1.66} \\
& \mathrm{~Pb}^{2+}+2 e^{-} \rightarrow \mathrm{Pb} \\
& -0.13
\end{aligned}
$$

III) Dependence of emf on Conc.
A) Nernst Equation

$$
\begin{gathered}
\Delta G=\Delta G^{\circ}+R T \ln Q \\
-n F E_{\text {cell }}=-n F E_{\text {cell }}^{0}+R T \ln Q \\
E_{\text {cell }}=E_{\text {cell }}^{0}-\frac{R T}{n F} \ln Q
\end{gathered}
$$

At $25^{\circ} \mathrm{C}$,

$$
E_{\text {cell }}=E_{\text {cell }}^{0}-\frac{0.0592}{n} \log Q
$$

(in volts)

1) Ex: Determine the voltage of the following cell:

$$
C_{r} / C_{r}^{3+}(0.010 \mathrm{~m}) \| \mathrm{Pb}^{2+}(1.00 \mathrm{~m}) / \mathrm{Pb}
$$

B) Electrode Pot. for NonStandard Conditions Can use the Nernsteqn to find the electrode pot. when conc. is not 1 m thor pressure is not 1 atm

1) Ex: what is the pot. of the iron electrode $\mathrm{Fe}^{2 t}(\mathrm{ag}) / \mathrm{Fe}(\mathrm{s})$ when the $\mathrm{Fe}^{2 t}$ conc. is $1.0 \times 10^{-4} \mathrm{~m}$ ?

$$
\begin{aligned}
& P t \mid H_{2}\left(1 a t_{m}\right) / H^{+}(1 \mathrm{~m}) / / \mathrm{Fe}^{2 t}\left(1.0 \times 10^{-4} \mathrm{~m}\right) / \mathrm{Fe}(\mathrm{~s}) \\
& \begin{aligned}
E_{c e \|} & =E\left(\mathrm{Fe}^{2 t} / \mathrm{Fe}\right)-E^{0}\left(H^{+} / H_{2}\right) \\
& =E\left(\mathrm{Fe}^{2+} / \mathrm{Fe}\right)
\end{aligned}
\end{aligned}
$$

Using Nernst eqn.,

$$
E\left(\mathrm{Fe}^{2 t} / \mathrm{Fe}\right)=E^{0}\left(\mathrm{Fe}^{2 t} \mid \mathrm{Fe}\right)-\frac{0.0592}{n} \log Q
$$

To find $n \times$ exp. for $Q$ write overall $r x$.

$$
\begin{aligned}
& \mathrm{Fe}^{2+}(\text { aq })+\mathrm{H}_{2}(\mathrm{q}) \rightleftharpoons \mathrm{Fe}(\mathrm{~s})+2 \mathrm{H}^{+}(\text {ag }) \\
& n=2 \quad+ \\
& Q=\frac{\left[\mathrm{H}^{+}\right]^{2}}{\left[\mathrm{Fe}^{2+}\right] \mathrm{H}_{2}}=\frac{1^{2}}{\left[\mathrm{Fe}^{2+}\right] \cdot 1}=\frac{1}{\left[\mathrm{Fe}^{2+]}\right]} \\
& \therefore \quad E\left(\mathrm{Fe}^{2+} / \mathrm{Fe}\right)=E^{0}\left(\mathrm{Fe}^{2+} / \mathrm{Fe}\right)-\frac{0.0592}{2} \log \frac{1}{\left[\mathrm{Fe}^{2+}\right]} \\
& \\
& =-0.41-0.1184 \\
& \\
& =-0.53 \mathrm{~V}
\end{aligned}
$$

2) Ex: Determine unknown conc. of $\mathrm{Cd}^{2+}$.

$$
\begin{aligned}
& \left.C d / C d^{2 t}(a g), ? m\right) \| \mathrm{Ag}^{+}(1 m) \mid \mathrm{Ag} \\
& C d+2 \mathrm{Ag}^{+} \rightarrow C d^{2+}+2 \mathrm{Ag}
\end{aligned}
$$

measure $E_{\text {cell }}=1.44 \mathrm{~V}$

$$
\begin{gathered}
E_{c e 11}=E_{c e 11}^{0}-\frac{0.0592}{n} \log \frac{\left[\mathrm{Cd}^{2+}\right]}{\left[\mathrm{Ag}^{+}\right]^{2}} \\
1.44=1.20-\frac{0.0592}{2} \log \left[\mathrm{Cd}^{2+}\right] \\
\log \left[\mathrm{Cd}^{2+}\right]=-8.11 \\
{\left[\mathrm{Cd}^{2+}\right]=7.8 \times 10^{-9} \mathrm{~m}}
\end{gathered}
$$

C) Determination of PH

$$
\mathrm{Pt} \mid H_{2}\left(1 \mathrm{la} t_{m}\right) / H^{+}(\text {(est } t \operatorname{son})\| \| H^{+}(1 \mathrm{~m}) \mid H_{2}\left(1 a_{\mathrm{tan}}\right) / P t
$$

$E_{\text {cell }}$ is due to test sola. half-cell

$$
\begin{gathered}
\frac{1}{2} H_{2}(1 \mathrm{~atm}) \rightleftharpoons H^{+}(\text {test sol. })+e^{-} \\
E_{\text {cell }}=-0.0592 \log \left[H^{+}\right], 25^{\circ} \mathrm{C}
\end{gathered}
$$

or

$$
p H=\frac{E_{\text {cell }}}{0.0592}
$$

D) Concentration Cells

Cell based solely on emf generated bee. of diff. in conc.
Use same electrode for both cathode of anode

- diff. conc. in each $\frac{1}{2}$-cell
Fred is same for both electrodes

$$
\begin{array}{ll}
C: M^{2 t}(\text { aq })+2 e^{-} \rightarrow M(s) & E_{\text {red }}^{0}=0.40 \mathrm{~V} \\
A: M(s) \rightarrow M^{2 t}(\text { aq })+2 e^{-} & E_{\text {red }}^{0}=0.40 \mathrm{~V}
\end{array}
$$

$$
\begin{aligned}
E_{\text {cell }}^{0} & =E_{\text {cat }}^{0}-E_{a n}^{0} \\
& =(0.40 \mathrm{~V})-(0.40 \mathrm{~V}) \\
& =0 \mathrm{~V}
\end{aligned}
$$

For a voltaic cell ox. occurs in $\frac{1}{2}$-cell containing the more dilute sorn.

- anode

$$
\begin{aligned}
& A: M(s) \rightarrow M^{2+}(\text { aq, dilute })+2 e^{-} \\
& C: \frac{M^{2 t}(\text { aq, conc })+2 e^{-} \rightarrow M(s)}{M^{2+}(\text { aq, conc }) \rightarrow M^{2+}(\text { aq, dilute })}
\end{aligned}
$$

$$
\begin{aligned}
E_{\text {cell }} & =E_{\text {cell }}^{0}-\frac{0.0592 \mathrm{~V}}{n} \log Q \\
& =0-\frac{0.0592 \mathrm{~V}}{n} \log \frac{\left[\mathrm{~m}^{2+}\right]_{\text {dilate }}}{\left[\mathrm{n}^{2+}\right]_{\text {conc }}} \\
E_{\text {cell }} & =-\frac{0.0592 \mathrm{~V}}{n} \log \frac{\left[\mathrm{~m}^{2+}\right]_{\text {dilate }}}{\left[n^{2+}\right]_{\text {conc }}}
\end{aligned}
$$

Note:
For voltaic cell $Q$ is $\frac{\text { [dilute] }}{\text { [conc] }}$

1) Ex: What is the Excel using a Cu electrode $w$. $\mathrm{Cu}^{2+}$ conc. of 0.00100 M and 2.00 M ?

$$
\mathrm{Cu}^{2+}(\text { aq })+2 e^{-} \rightarrow \mathrm{Cu}(\mathrm{~s}) \quad E^{0}=+0.337 \mathrm{~V}
$$

(III) Practical Applications
A) Corrosion Protection

Iron rusts
$\mathrm{Fe} \rightarrow \mathrm{Fe}^{2+}+2 e^{-}$ox.

Place $F e$ in contact w. a more active metal (more easily oxidized)

Felfe ${ }^{2 t}$ becomes cathode
Metal becomes anode
Cathodic Protection

1) Under ground Pipe

Fe pipe connected to Mg or $Z_{n}$ rod

$$
\mathrm{Mg}+\mathrm{Fe}^{2 t} \rightarrow \mathrm{Mg}^{2 t}+\mathrm{Fe}
$$

2) Galvanized Iron

$$
\mathrm{Zn}+\mathrm{Fe}^{2 t} \rightarrow \mathrm{Zn}^{2 \dagger}+\mathrm{Fe}
$$

B) Fuel Cells

Convert energy of combustion directly into electrical energy

$$
\begin{aligned}
& 2 \mathrm{H}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{H}_{2} \mathrm{O}(\mathrm{e}) \\
& \mathrm{C} / \mathrm{H}_{2}(\mathrm{~g}) / \mathrm{OH}^{-}(\mathrm{ag}) / \mathrm{O}_{2}(\mathrm{~g}) / \mathrm{C}
\end{aligned}
$$

anode: $\left(\mathrm{H}_{2}+2 \mathrm{OH}^{-} \rightarrow 2 \mathrm{H}_{2} \mathrm{O}+2 \mathrm{e}^{-}\right)_{2}$
cathode: $\frac{\mathrm{O}_{2}+2 \mathrm{H}_{2} \mathrm{O}+4 \mathrm{e}^{-} \rightarrow 4 \mathrm{OH}^{-}}{2 \mathrm{H}_{2}+\mathrm{O}_{2} \rightarrow 2 \mathrm{H}_{2} \mathrm{O}}$
$60-70 \%$ efficient

IX) Electrolytic Cells

Energy from external source is used to bring about a non spent. chem. $r x$.

Cell is driven by a battery

- Acts as an $e^{-}$pump - pushes $e$ - onto one electrode $\&$ pulls them from another
A) Electrolysis of Molten NaCl

$$
\begin{array}{lc} 
& E^{0}(\mathrm{~V}) \\
\mathrm{Cl}_{2}+2 e^{-} \rightarrow 2 \mathrm{Cl}^{-} & +1.36 \\
\mathrm{Na}^{+}+e^{-} \rightarrow \mathrm{Na} & -2.71
\end{array}
$$

anode: $2 \mathrm{Cl}^{-} \rightarrow \mathrm{Cl}_{2}+2 e^{-}$

$$
(o x)
$$

Cathode: $2\left(\mathrm{Na}^{+}+\mathrm{e}^{-} \rightarrow \mathrm{Na}\right)$
(red.)

$$
2 \mathrm{NaCl}(\mathrm{l}) \rightarrow 2 \mathrm{Na}(\mathrm{~s})+\mathrm{Cl}_{2}(\mathrm{~g})
$$

1) $E_{\text {cell }}^{0}$

$$
\begin{aligned}
E_{c e l l}^{0} & =E_{c a t}^{0}-E_{a n}^{0} \\
& =E_{N a}^{0}-E_{C_{2}}^{0} \\
& =(-2.71)-(11.36) \\
& =-4.07 \mathrm{~V}
\end{aligned}
$$

Non spout.
Note: sign convention for eletrodes is Opposite that for voltaic cells

## Transparency 144 Figure 20.16 Electrolysis of molten sodium chloride

X) Stoichiometry of Electrolysis

How much product is formed? How long will it take?

$$
\begin{aligned}
& 1 C=1 \mathrm{~A} \cdot \mathrm{~A} \\
& 1 F=96,500 \mathrm{C} / \text { mole } e^{-}
\end{aligned}
$$

A current of 0.50 A flowing for 84 seconds gives a charge of,

$$
0.50 A \times 84 A=42 C
$$

A) Time and Amount

1) Ex: Chrome-plate an object. How long would it take to deposit 35.5 g Cr from a soln. of $\mathrm{CrCl}_{3}$ at a current of 6.00 A ?
$\mathrm{Cr}^{3+}+3 e^{-} \rightarrow \mathrm{Cr}$ (cathode)
3 mole $e^{-}$reg. for each mole Cr
a) How fast does this occur?

$$
6.00 \mathrm{~A}=6.00 \mathrm{c} / \mathrm{A}
$$

b) How many grams of $\mathrm{Cl}_{2}$ are produced?
B) Electrical Work

1) Voltaic Cell

$$
\begin{aligned}
w_{\text {max }} & =-n F E_{c e l l} \\
-w_{\text {max }} & \left(w_{\text {max }}<0\right) \\
& \Rightarrow \text { spont. }
\end{aligned}
$$

(max work obtainable)
2) Electrolytic Cell

Non spout. $(\Delta G>0, E<0)$

- supply external potential

$$
w=n F E_{\text {ext }}
$$

surf. doing work on system
3) Units

Electrical work usually expressed in energuunits of watts $x$ time

$$
1 W=1 \mathrm{~J} / \mathrm{s}
$$

electric utilities use kW -hour

$$
\begin{aligned}
1 k W h & =(1000 \mathrm{~W})(1 \mathrm{hr})\left(\frac{3600 \mathrm{~s}}{1 \mathrm{hr}}\right)\left(\frac{1 \mathrm{~J} / \mathrm{l}}{1 \mathrm{~W}}\right) \\
& =3.6 \times 10^{6} \mathrm{~J}
\end{aligned}
$$

4) Ex: What applied emf is required to produce $2.0 \times 10^{3} \mathrm{~kg}$ of Al by electrolysis of $\mathrm{Al}^{3+}$ if $1.0 \times 10^{4} \mathrm{k}$ Th of electricity is used?
