

# Chapter 2

## Atoms, Molecules and Ions

### I) Atoms

#### A) Dalton's Atomic Theory

1) Elements composed of minute, indivisible particles called,

Atoms

2) Atoms of an element are identical & different from atoms of any other elements

- have different properties & different masses

3) Atoms combine in whole numbers to form compounds (molecules)

### Law of Multiple Proportions

4) Compounds are composed of atoms of diff. elements chemically combined.

- relative number of each type of atom is constant

### Law of Constant Composition

5) In chemical rxn's, atoms are rearranged, but the number & kind of atoms is unchanged

### Law of Conservation of Mass

## II) Sizes of Atoms

### A) Mass

mass of H =  $1.67 \times 10^{-24}$  g

Define atomic mass unit

1 amu =  $1.6603 \times 10^{-24}$  g

Masses of atoms: 1 - 260 amu

## B) Radius (Volume)

Atoms pictured as spherical

Radii

$$0.5 \times 10^{-8} \text{ cm} \rightarrow 2.4 \times 10^{-8} \text{ cm}$$

Use nm,

$$0.05 \text{ nm} \rightarrow 0.24 \text{ nm}$$

Also use angstrom, Å

$$1 \text{ Å} = 10^{-10} \text{ m} = 10^{-8} \text{ cm}$$

$$\therefore 0.5 \text{ Å} \rightarrow 2.4 \text{ Å}$$

### III) Subatomic Particles

Atom is composed of smaller subatomic particles

Atom: smallest particle of an element that retains properties of that element

A) Electron,  $e^-$

charge =  $- 1.6022 \times 10^{-19} \text{ C}$   
(coulomb)

$m_{e^-} = 9.1094 \times 10^{-28} \text{ g}$   
 $= 5.486 \times 10^{-4} \text{ amu}$

## B) Proton, p

Matter is neutral:

removal of  $e^-$  leaves a (+) charged particle

remove  $e^-$  from H  
 $\Rightarrow H^+$ , a proton (p)

- fundamental particle

charge =  $+ 1.6022 \times 10^{-19} \text{ C}$

$m_p = 1.6726 \times 10^{-24} \text{ g}$

= 1.0073 amu

$m_p \approx 1836 m_{e^-}$

Other atoms contain  $> 1$  p

Number of protons in atom  
characteristic of element

Atoms are neutral,

$$\# p = \# e^{-}$$

C) Neutron, n

Only about  $\frac{1}{2}$  of mass of atoms  
accounted for by protons

charge = 0

$$\begin{aligned} m_n &= 1.6749 \times 10^{-24} \text{ g} \\ &= 1.0088 \text{ amu} \end{aligned}$$

$$m_n \approx m_p$$

## D) Summary of Subatomic Particles

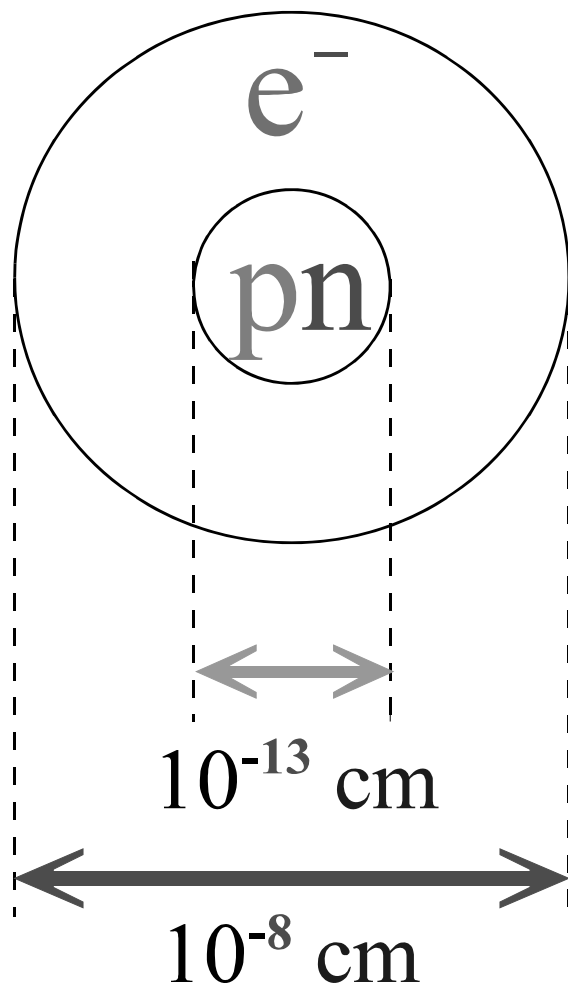

particle	symbol	mass (amu)	relative charge
electron	$e^-$	0.0005486	-1
proton	p	1.0073	+1
neutron	n	1.0088	0

$$m_n \approx m_p \gg m_{e^-}$$

## E) Nuclear Model of the Atom

Atom composed of dense nucleus, containing protons & neutrons & most of atom's mass surrounded by  $e^-$  in motion in mostly empty space

diameter of  
atoms very  
small

## IV) Composition of Atoms

### A) Atomic Number, Z

$Z = \#$  of protons

Distinguishes atoms of one element from those of another

Whole number in block w. chemical symbol in P.T.

Elements in P.T. ordered by inc. atomic no.

In neutral atom,  $\# p = \# e^-$

### B) Mass Number, A

$A = \# p + \# n$

## C) Elemental Symbol

Describes composition of nucleus

1) Ex 1: What does the following symbol represent?

Sometimes only show mass #

2) Ex 2:

## D) Isotopes

Atoms of same element which have different numbers of neutrons

∴ same atomic #,  $Z$   
different mass #,  $A$

“ $A$ ” distinguishes between isotopes of the same element

Note: Isotopes of the same element have the same chemical properties

1) Ex: Naturally occurring boron consists of 2 isotopes

## B) Atomic Weight

A.W. scale based on assignment of exactly 12 amu to  $^{12}_6\text{C}$

A.W. is weighted average of naturally occurring isotopes expressed in amu

1) EX: The two isotopes of silver are  $^{107}\text{Ag}$  and  $^{109}\text{Ag}$ , having natural abundances of 51.35% and 48.65%, respectively. Their isotopic masses are 106.916 & 108.914 amu, respectively. Determine the A.W. of Ag.

## V) Periodic Table

### A) Periodic Law

Mendeleev: table based on idea that properties of elements are periodic functions of their A.W.

- exceptions: I & Te ; Ar & K

Moseley: proper correlation is with atomic number

#### 1) Modern Periodic Law

Properties of the elements are periodic functions of their

Atomic Number

## B) Modern Periodic Table

Arrangement of elements in order of inc. atomic no., placing those with similar chem. and phys. prop. in columns.

### 1) Groups

Vertical columns called  
groups or families

- elements within a group  
have similar prop.

Labeled at top of column by  
Roman numerals (I - VIII) or  
Arabic numerals (1 - 8) and  
letter, A or B

**Transparency 13 Figure 2.16 Periodic table divided into metals, nonmetals, and semimetals**

1A	1 H								2A						3A	4A	5A	6A	7A	8A

CHEMISTRY: THE CENTRAL SCIENCE  
by Brown/Le May/Bursten

## a) Representative Elements

(main-group elements)

1 A - 8 A

### 1) Specific Group Names

1 A      alkali metals

2 A      alkaline earth metals

7 A      halogens

8 A      noble or rare gases

## b) Transition Metal Elements

1 B - 8 B

- metals

## 2) Periods

Horizontal rows called periods

Two long rows below  
main body of table are:

Inner transition elements  
- lanthanides & actinides

1 <sup>st</sup> period	H - He	2 elements
2 <sup>nd</sup> period	Li - Ne	8 elements
3 <sup>rd</sup> period	Na - Ar	8 elements
4 <sup>th</sup> period	K - Kr	18 elements
5 <sup>th</sup> period	Rb - Xe	18 elements
6 <sup>th</sup> period	Cs - Rn	32 elements

## Metals

solids  
(except Hg)

metallic  
luster

malleable  
& ductile

good conductors  
of  
heat & electricity

oxides:

nonvolatile  
high melting  
MgO, Na<sub>2</sub>O

## Nonmetals

gases or solids  
(except Br)

variety of color  
& appearance

solids are  
brittle

poor conductors  
(insulators)

oxides:

volatile  
low melting  
CO, CO<sub>2</sub>, SO<sub>2</sub>

# VI) Molecular Elements & Compounds

## A) Molecular Substances

Group of chemically bonded atoms which has the characteristic properties of the substance

### 1) Molecular Elements

#### a) Diatomics

Contain 2 atoms

$H_2$                       2 H atoms  
bonded together

other diatomic elements

$N_2, O_2, F_2, Cl_2, Br_2, I_2$

## b) Polyatomics

## 2) Molecular Compounds

Molecules of compounds contain  
2 or more diff. elements

2 H atoms &  
1 O atom

carbon dioxide

1 C atom &  
2 O atoms

### 3) Molecular Formula

Actual number of each kind of atom in a molecule

$C_6H_6$       Benzene

$C_2H_5OH$     Ethanol

### 4) Empirical Formula

Relative number of atoms of each kind in a molecule

- smallest whole-number ratio of atoms

$C_1H_1$       Benzene or acetylene

Subscripts in a molecular formula are always some integer multiple of subscripts in empirical formula

## 5) Structural Formula

Gives an idea about the structure of the molecule

### Ethanol

## VII) Ionic Substances

### A) Ions

particle that contains more or fewer  $e^-$  than protons

∴ Has NET electrical charge

$$\text{Total charge} = \# p - \# e^-$$

#### 1) Anion

Negative ion resulting from gain of 1 or more  $e^-$  by neutral atom

a) Ex:

$\text{Br}^-$  has 1 extra  $e^-$  than Br

( # p does NOT change)

b) Ex:

\* Formation of anions is a property of nonmetals

## 2) Cation

Positive ion resulting from loss of 1 or more  $e^{-}$  by neutral atom

a) Ex:

\* Formation of cations is a property of metals

### 3) Predicting Charge Using P.T.

#### Representative Elements

I A - VIII A

gain or lose  $e^-$  to achieve same  
#  $e^-$  as nearest noble gas

isoelectronic series

( same #  $e^-$  )

## a) Cation Groups

charge = group #

I A = + 1  $\text{Li}^+$

II A = + 2  $\text{Mg}^{2+}$

## a) Special Cations

## 2) Anion Groups

charge = group # - 8

V A = - 3  $\text{N}^{3-}$

VI A = - 2  $\text{O}^{2-}$

VII A = - 1  $\text{F}^-$

A PERIODIC CHART OF THE ELEMENTS  
(Based on <sup>12</sup>C)

## B) Ionic Compounds

Oppositely charged ions held together by electrostatic attractions

Combinations of metals & nonmetals

Crystalline solids (salts)

### 1) Formula Units

Compounds are electrically neutral

total (+) chg = total (-) chg

NaCl          neutral

(cation)(anion)

Formula shows simplest  
ratio of ions

- empirical formula

NOT a molecule

3-D arrangement of ions

a) Ex : Cmpd. formed from  
 $\text{Ca}^{2+}$  &  $\text{CO}_3^{2-}$

$\text{Ca CO}_3$   
cation anion

## VIII) Naming Ions

### A) Monatomic Ions

#### 1) Cations

Use name of element followed by “ion”

$K^+$  potassium ion

$Zn^{2+}$  zinc ion

#### 2) Anions

Add “ide” to root of element’s name

$Br^-$  bromide ion

$S^{2-}$  sulfide ion

## B) Stock System & Older System

Many metals have more than one possible charge

- transition metals
- representative metals

	<u>Stock</u>	<u>Older</u>
$\text{Fe}^{2+}$	iron (II)	ferrous
$\text{Fe}^{3+}$	iron (III)	ferric
$\text{Cu}^{+}$	copper (I)	cuprous
$\text{Cu}^{2+}$	copper (II)	cupric
$\text{Sn}^{2+}$	tin (II)	stannous
$\text{Sn}^{4+}$	tin (IV)	stannic

## C) Polyatomic Ions

Group of chemically bonded atoms with an overall charge

### 1) Polyatomic Anions ending in -ide

$\text{OH}^-$       hydroxide      ion

$\text{CN}^-$       cyanide      ion

## 2) Polyatomic Cations

$\text{NH}_4^+$  ammonium ion

$\text{H}_3\text{O}^+$  hydronium ion

$\text{Hg}_2^{2+}$  mercury (I) ion

## 3) Misc. Polyatomic Anions

$\text{MnO}_4^-$  permanganate ion

$\text{C}_2\text{H}_3\text{O}_2^-$  acetate ion

$\text{CrO}_4^{2-}$  chromate ion

$\text{Cr}_2\text{O}_7^{2-}$  dichromate ion

## 4 ) Polyatomic Anions - Oxyanions

Carbonate

Chlorate

Nitrate

Phosphate

Sulfate

## a) Vary Number of Oxygens

Prefixes & suffixes indicate changes made to base anion.

### 1) Suffixes

-ate                      base anion

-ite                      1 less O-atom  
                                 than -ate

Nitrite                   $\text{NO}_2^-$

### 2) Prefixes

per- (over)              1 more O-atom  
                                 than -ate

hypo- (under)          1 less O-atom  
                                 than -ite

3) Ex 1:

$\text{ClO}_4^-$	perchlorate
$\text{ClO}_3^-$	chlorate
$\text{ClO}_2^-$	chlorite
$\text{ClO}^-$	hypochlorite
$\text{Cl}^-$	chloride

4) Ex 2: What is bromate, perbromate, hypoiodite?

5) Ex 3: What is  $\text{SO}_3^{2-}$  ?

Note: Overall charge on the “family” of anions remains same

b) Addition of H<sup>+</sup> to  
-2 or -3 Oxyanion

Resulting species still charged  
- anions

### c) Acids

H<sup>+</sup> combines with anion to produce a neutral compound  $\Rightarrow$

#### Acid

Not ionic but ionize in H<sub>2</sub>O to produce H<sup>+</sup> (H<sub>3</sub>O<sup>+</sup>)

#### 1) Binary Acids

Hydrogen + nonmetal

-ide  $\Rightarrow$  -ic acid

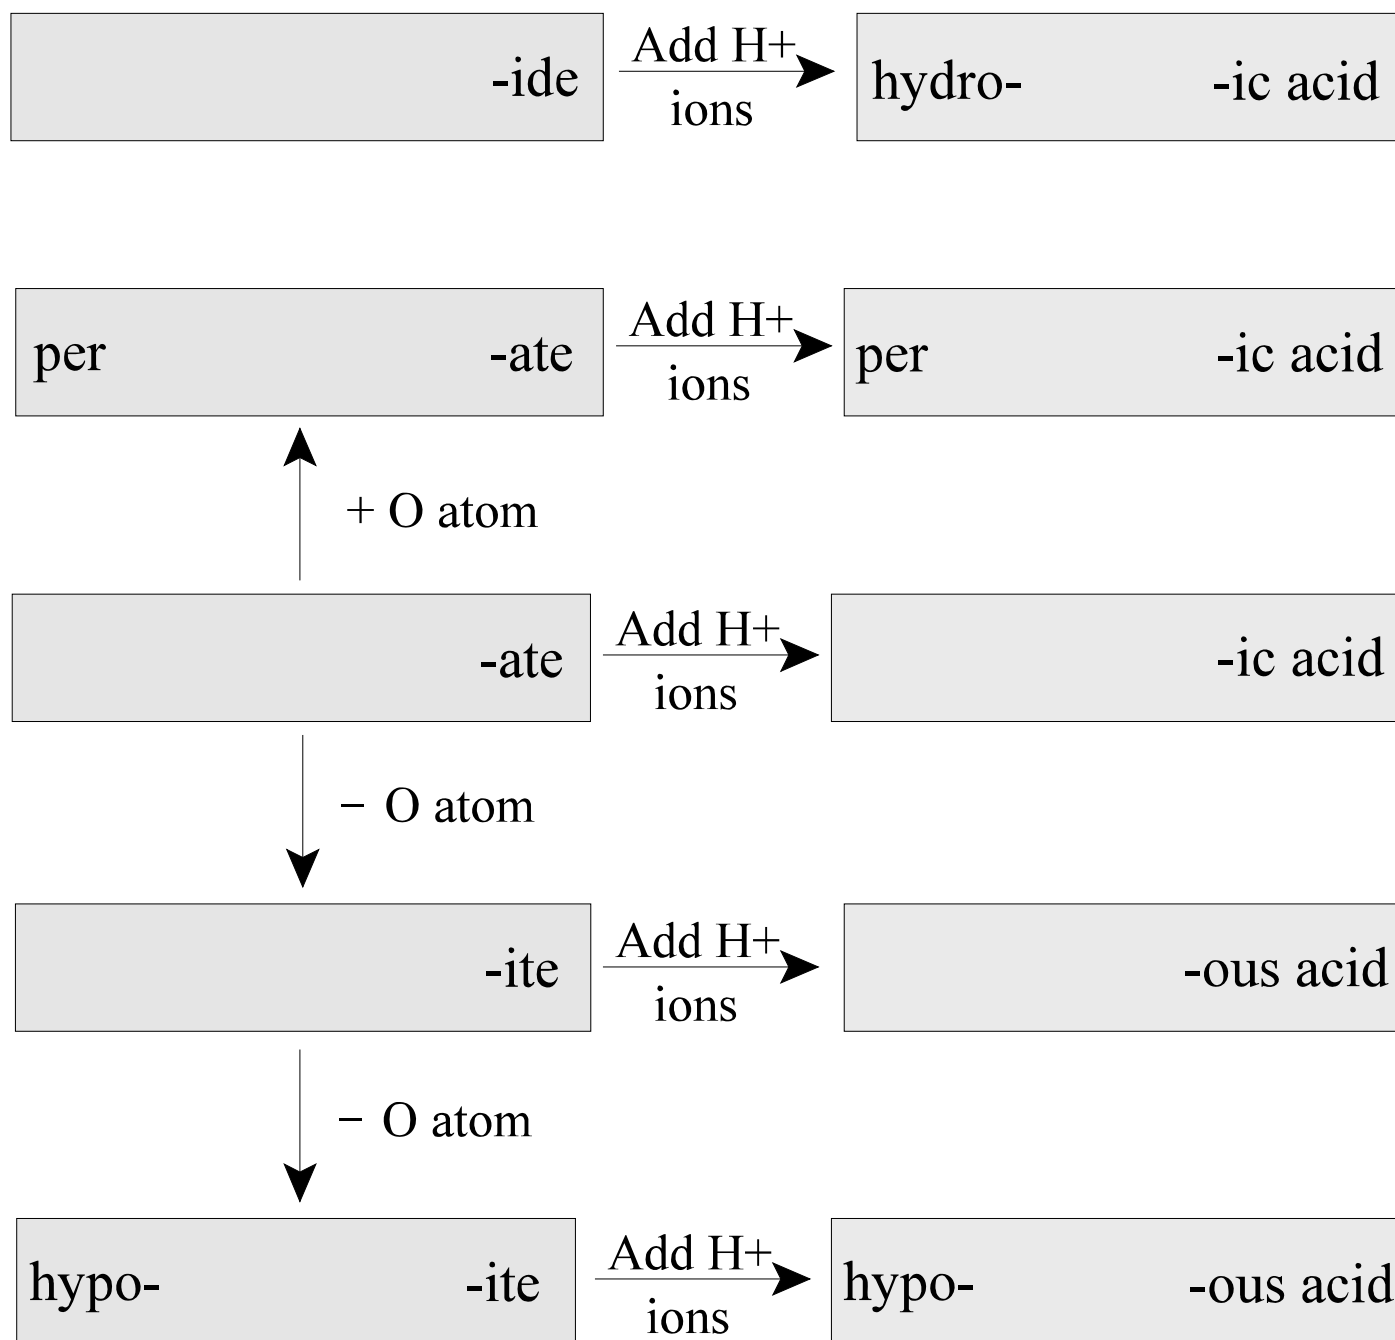

Precede name with hydro-

HF(aq) hydrofluoric acid

# Summary of Acid/Anion Naming

Anion

Acid

## IX) Formulas & Names of Ionic Compounds

1) Ex 1: What compound is formed from  $\text{Ca}^{2+}$  and  $\text{CO}_3^{2-}$  ?

2) Ex 2:  $\text{NH}_4^+$  and  $\text{S}^{2-}$

3) Ex 3:  $\text{Al}^{3+}$  and  $\text{SO}_4^{2-}$

4) Ex 4:  $\text{Sn}^{4+}$  and  $\text{O}^{2-}$

5) Ex 5: Write the formula for manganese (IV) oxide.

6) Ex 6: Write the formula for iron(II) sulfite.

## X) Binary Molecular Compounds

2 diff. elements

nonmetals

or

nonmetals & semimetals

Usually, element further to left & lower in column in PT (less electronegative) given first

B	Si,C	As,P,N	H	Se,S	I,Br,Cl	O	F
3A	4A	5A	*	6A	7A	*	7A

SiC      silicon carbide

NO      nitrogen monoxide

H<sub>2</sub>S      hydrogen sulfide

## A) Same Element; Multiple Compounds

Greek prefix indicates number of atoms of each element
